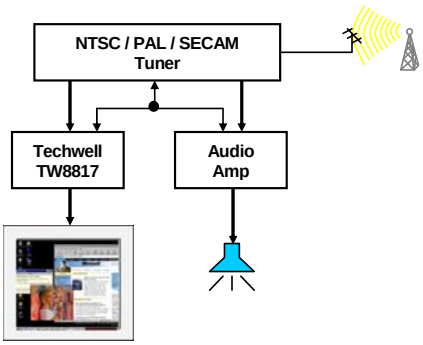
Introduction



Applications

- Mobi l LCD TVs
- Rear seat entertainment
- Portable DVD, PMP and HMD (Head Mount Display)

Features

The TW8817 is a l ow co st high quality TFT pan el controller w ith embedd ed NTSC/PAL/SECAM TV decoder. It incorporates all the features required to create multi-purpose low cost LCD TV systems in a si ngle package. It contain s a ll the ci rcuits req uired to adapt standard NTSC/PAL/SECAM analog TV input signals for display o n va rious TFT LCD panel types. An integrated timing controller allows d irect in terface with d igital LCD panels. Its versatile analog in puts allow CVBS, S -video, signal to be connected simultaneously.

Other features include: high quality a daptive 4 H Comb Filter, downscaling to QVGA output resolution, interlaced and progressive ITU 656 input support, 2D de-interlacer and panaromic scal er, and multi -window programmalbe OSD. It also includes image enhancement functions such as black and white stretch, 2D peaking, CTI, and favorite color enhancement to further impr ove p icture q uality. it also i ncludes cost sa ving fea ture l ike CCFL controller, charge pu mp booster and progra mmable p anel offset control. In ad dition, TW8817 h as bui lt-in microcontroller with external SPI interface.

Analog Video Decoder

NTSC (M, 4.34) and PAL (B, D, G, H, I, M, N, N combination), PAL (60), SECAM with automatic format detection

- Advanced synchronization processing for VCR trick play signal
- Two 10-bit ADCs and analog clamping circuit.
- Built-in analog anti-aliasing filter
- Fully programmable static g ain o r automatic g ain c ontrol f or the Y or CVBS channel
- Programmable white peak control for the Y or CVBS channel
- Software selectable analog inputs allows any of the following combinations:
  - 3 composite video
  - 1 S-Video
- 4-H adaptive comb filter Y/C separation
- PAL delay line for color phase error correction
- Digital PLL for both color and horizontal locking
- Programmable hue , br ightness, s aturation, contrast, sharpness, Gamma control, and noise suppression
- Automatic color control and color killer
- Detection of level of copy protection according to Macrovision standard

Built-in Microcontroller

- Support external SPI Interface
- Support I2C Master interface with GPIO
- Support Up to 4 MCU GPIO
- Support UART interface with GPIO
- Support IR or interrupt with GPIO

TFT Panel Support

- Supports a wide variety of Digital single pixel active matrix TFT panels
- Supports 3, 4, 6 bits per pixel format

On Screen Display

- Built-in OSD c ontroller w ith integrated c haracter ROM and programmable RAM font.
- Multi-window OSD support with color pallet
- Support OSD ovelay with alpha blendg

Image Control
- Programmable hue, brightness, saturation, contrast
- Sharpness control with vertical peaking
- Programmable color transient improvement control
- Built-in de-interlacing engine
- Independent RGB gain and offset controls
- Panorama / Water-glass scaling
- YCbCr hue adjustment
- Programmable Gamma correction tables

Power Management
- Supports Panel power sequencing.
- Supports DPMS for monitor power management.
- 1.8 / 3.3 V operation

Timing Controller (TCON)
- Support programmable interface signals for control
- Built-in YCbCr to RGB color space converter
- Black/White Stretch
- Programmable favorite color enhancement

Column (source) driver / row (gate) driver

Miscellaneous
- Supports 2-wire serial bus interface
- Spread spectrum PLL
- CCFL controller
- LED controller
- Low-speed ADC for KEY scan
- Programmable panel VCOM offset control
- 5V tolerant I/O
- Power-down mode
- Typical power consumption less than TBD
- Single 27MHz crystal
- 80-pin TQFP package

Order Information

Package Description

Part #	Name	Description	Pins	Body Size (mm)
TW8817	TQFP	Thin Quad Flat Package	80	12x12

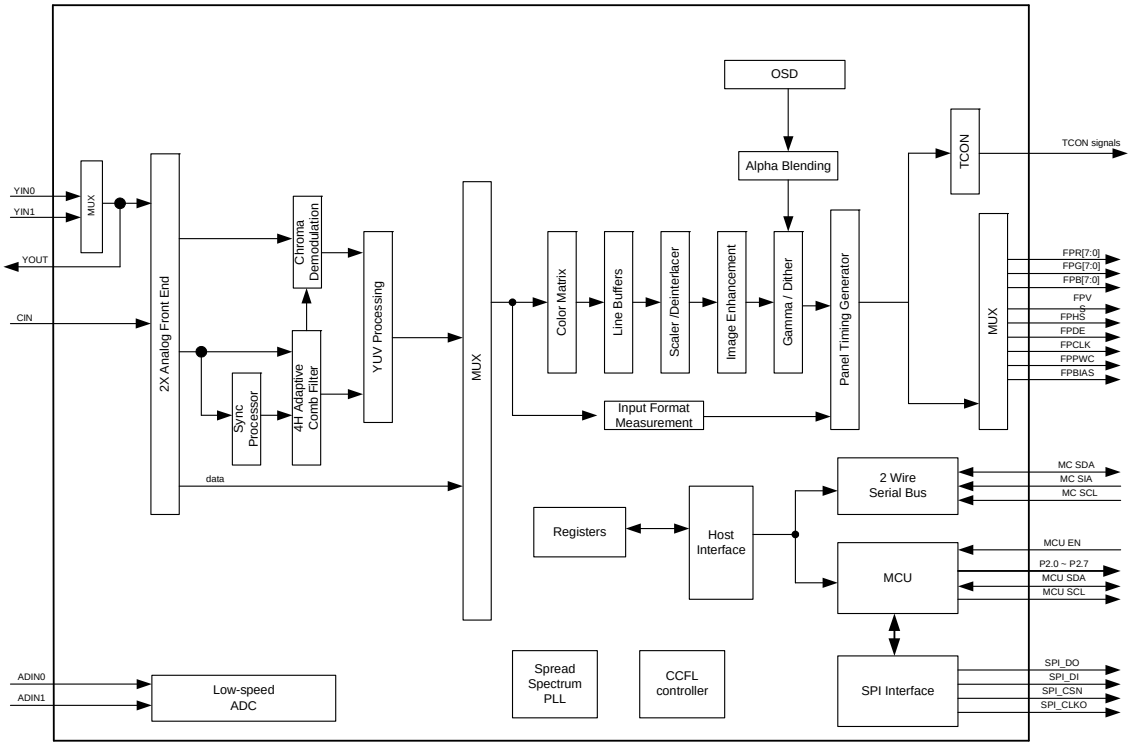


Figure 1 TW8817 Flat Panel TV/Monitor controller functional block diagram

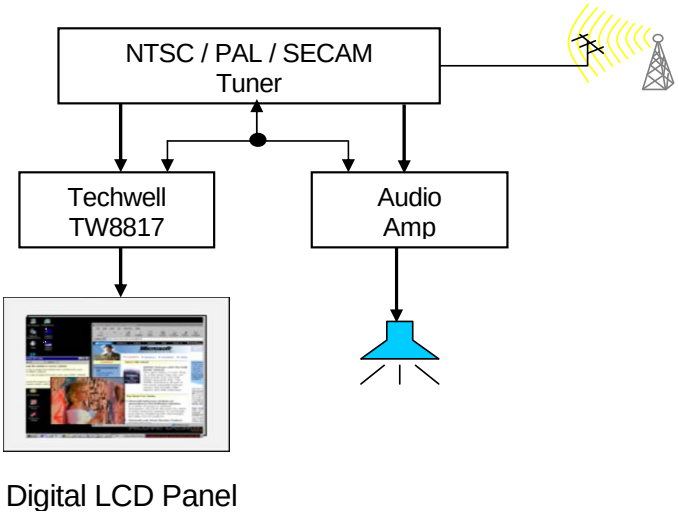

Figure 2 TW8817 Flat Panel TV/Monitor controller system block diagram

Functional Description

Overview

Techwell's TW8817 Flat Panel TV/Monitor controller is a low cost high quality TFT panel controller with embedded NTSC/PAL/SECAM TV decoder. This unique level of mixed signal integration enables the panel to be used as a stand-alone analog TV. Separated digital inputs allow it to be used as a high quality computer monitor. It incorporates easy-to-operate and powerful features in a single package for multi-purpose PC display and LCD/TV entertainment systems.

The TW8817 contains all the logic required to convert standard TV, DTV, and PC monitor signals to the digital control and data signals required to drive various TFT panel types. It supports TFT panel resolutions up to WXGA.

The chip accepts CVBS (composite) analog input or S-video analog input, up to two CVBS inputs or one S-video input.

The integrated analog front-end contains 2 ADCs with clamping circuits and Automatic Gain Control (AGC) circuit to minimize external component count. It employs a 4H, 5-line adaptive comb filter and proprietary Y/C processing technologies to produce exceptionally high quality pictures.

The chip's internal logic synchronizes the panel frame rate to the incoming input frame rate. A high quality image-scaling engine is used to convert the lower resolution formats or high resolution DTV formats to the output panel resolution. An internal de-interlacing engine also allows interlaced video to be supported.

On Screen Display is supported through on-chip OSD ROM/RAM combination for maximum flexibility. A Closed Caption decoder is built in. The TW8817 also accepts a 16 bit digital RGB input from external digital sources for use as Navigation monitor. In addition, it accepts 8/16 bits digital YCbCr input for direct connection with other digital source like MPEG decoder.

The TW8817 also supports TFT panel power sequencing, DPMS (VESATM Display Power Management Signaling) signaling and power management. The control interface is a 2-wire serial bus interface. The TW8817 core operates at 1.8 V, the IO at 3.3 V and packaged in a 80-pin TQFP package.

Analog Front-end

The analog front-end converts analog video signals to the required digital format. There are three analog channels. Each channel contains clamping circuit, AGC circuit, Anti-aliasing filter and high performance ADCs to minimize the external component used. There are total 3 analog inputs for maximum flexibility. Software selectable analog inputs allow many possible input combinations between composite video, S-video.

Video Decoder

The video decoder of TW8817 consists of synchronization, Y/C separation, color decoding and component processing circuits. The sync processor contains digital phase-locked-loop and decision logic to achieve reliable sync detection in stable signal as well as in non-standard signals such as those from VCR playback. It also provides exceptional weak signal performance.

Y/C separation

The Y/C separation block provides the luma / chroma separation for the composite video. For NTSC and PAL standard signals, this is achieved through high quality 5-line adaptive comb filter. For SECAM standard signals, adaptive notch/band-pass filter is employed. Due to the line buffer used in the comb filter, there is always two lines processing delay in the output images no matter what standard or filter option is chosen. If notch/band-pass filter is selected, the characteristics of the filters are shown in the filter curve section.

Color demodulation

The color demodulation for NTSC and PAL standard is done by quadrature mixing the chroma signal to the base band. The sub-carrier signal for use in the color demodulator is generated by direct digital synthesis PLL that locks onto the input sub-carrier reference (color burst). This arrangement allows any sub-standard of NTSC and PAL to be demodulated easily. For the PAL system, the PAL ID is identified to aid the PAL color demodulation. The SECAM demodulation process is done through FM demodulation and de-emphasis filter. The chroma carrier frequency is identified and used to control the SECAM color demodulation.

Automatic Chroma Gain Control

The Automatic Chroma Gain Control (ACC) compensates for reduced amplitudes caused by high-frequency loss in video signal. The range of ACC control is –6db to +24db. For low color amplitude signals, black and white video, or very noisy signals, the color output will be “killed”. The threshold has programmed hysteresis to prevent oscillation of the color killer operation. This function can be disabled by programming a low threshold value.

Automatic standard detection

The TW8817 has build-in automatic standard discrimination circuitry. The circuit uses burst-phase, burst-frequency and frame rate to identify NTSC, PAL or SECAM color signals. The standards that can be identified are NTSC (M), NTSC (4.43), PAL (B, D, G, H, I), PAL (M), PAL (N), PAL (60) and SECAM (M). Each standard can be included or excluded in the standard recognition process by software control. The identified standard is indicated by the Standard Selection (SDT) register. Automatic standard detection can be overridden by software controlled standard selection.

TW8817 supports all common video formats as shown in Table 1. The video decoder needs to be programmed appropriately for each of the composite video input formats.

Table 1. Video Input Formats Supported by the TW8817

Format	Lines	Fields	Fsc	Country
NTSC-M	525	60	3.58 MHz	U.S., many others
NTSC-Japan (1)	525	60	3.58 MHz	Japan
PAL-B, G	625	50	4.43 MHz	Many
PAL-D	625	50	4.43 MHz	China
PAL-H	625	50	4.43 MHz	Belgium
PAL-I	625	50	4.43 MHz	Great Britain, others
PAL-M	525	60	3.58 MHz	Brazil
PAL-CN	625	50	3.58 MHz	Argentina
SECAM	625	50	4.406MHz 4.250MHz	France, Eastern Europe, Middle East, Russia
PAL-60	525	60	4.43 MHz	China
NTSC (4.43)	525	60	4.43 MHz	Transcoding

Notes: (1). NTSC-Japan has 0 IRE setup.

Component Processing

The TW8817 adjusts brightness by adding a programmable value (in register BRIGHTNESS) to the Y signal. It adjusts the picture contrast by changing the gain (in register CONTRAST) of the Y signal.

The TW8817 also provides a sharpness control function through control registers. It provides the control in 16 steps up to +12db. The center frequency of the enhancement curve is selectable by software control. It also provides a high frequency coring function to minimize the amplification of high frequency noise. To further enhance the image, a programmable vertical peaking function is provided for up to +6db of enhancement.

The TW8817 provides the Color Transient Improvement function to further enhance the image quality. The CTI enhance the color edge transient without any hue distortion.

The color saturation can be adjusted by changing the gain of Cb and Cr signals for all NTSC, PAL and SECAM formats. The Cb and Cr gain can be adjusted independently for flexibility.

Digital Input Support

In addition to analog inputs, the TW8817 has a 16-bit digital input for YCbCr or RGB data. External ADCs can be used to make the conversion from analog component inputs to digital YCbCr or RGB to support of DTV 480p, 720p, and 1080i, or PC VGA inputs from QVGA to WXGA. The input includes VSYNC, HSYNC, pixel clock and the optional data qualifier. For interlaced video, the timing relationship between VSYNC and HSYNC determine the field flag. The optional data qualifier is needed when input video data is not continuously valid within a line.

TFT Panel Support

The TW8817 supports varieties of Digital active matrix TFT panels with one pixel per clock mode. It supports panel with resolution up to WXGA resolution.

Dithering

If the color depth of the input data is larger than the LCD panel color depth, the TW8817 can be set to dither the image. Up to four bits of apparent color depth can be added with the internal dithering ability of the TW8817. This allows LCD panels with 4, 6 or 8 bits per color per pixel to display up to 16.8 million colors and LCD panels with 3 bits per color per pixel to can display up to 2.1 million colors.

The TW8817 uses both spatial and frame modulation dithering. When dithering with the least significant 4-bits of input data the TW8817 uses spatial modulation with 4x4 blocks of pixels. When dithering with the least significant 1 to 3 bits of input data, the TW8817 uses both spatial modulation with 2x2 pixel blocks, and frame modulation.

Image Control

Input Image Control

The input cropping control provides a way for programming the active display window region for the selected input video or graphic. In the normal operation, the first active line starts with the VSYNC signal. This and vertical active length register setting are used to determine the active vertical window. The active pixel starts HSYNC. This and the horizontal active width register are used to determine the active horizontal window. The vertical window is programmed in line increments. The horizontal window is programmed in one pixel increments for single pixel input mode or two pixels increments for double pixels input mode. If data qualifier is used, then only qualified pixels will be counted in the window size.

Image Scaling

The TW8817 internal image-scaling engine operates in several modes. The first is the bypass mode. No image scaling is done in this mode. The number of active output lines per frame and the number of active output pixels per line are identical to the input active lines and pixels, respectively. This mode is best used for displaying computer graphic at panel's native resolution.

By default, the input active window is zoomed up to the full screen for display. This is used for non-interlaced data like PC graphics or progressive scan video. The vertical and horizontal magnification ratio can be adjusted independently. Since the TW8817 has no frame buffer, the zoom ratio and output clock rate should be coordinated appropriately to avoid internal buffer over-run.

The TW8817 has a de-interlacing mode to process interlaced video inputs. In this mode, every input field is zoomed to the full output frame resolution. A proprietary low angle compensation circuitry adaptively corrects the interpolation process to result in smooth video rendering. The de-interlaced fields can also be properly compensated to have fields aligned correctly to avoid any artifacts. The offset can be programmed to provide maximum flexibility.

The horizontal scaler can be programmed to perform panoramic or water-glass scaling for displaying 4:3 input on a 16:9 display.

Image Enhancement Processing

Adaptive Black/White Stretch
This feature is to expand dynamic range of the input image, which creates more vivid image impression.

Favorite Color enhancement
This feature allows enhancement of color that is not primary color. Up to three user programmable colors can be selected for enhancement. The gain for each color selected is adjustable for maximum flexibility. It yields rich and colorful video images.

Display Timing

The TW8817 is operated in Frame Sync mode only with no external memory required. In this mode, the output frame rate is synchronized with the input frame rate. Since there is no frame buffer, the display clock frequency and zoom ratio have to be properly selected to match the panel resolution. The internal scaling engine absorbs the difference between the input line rate and output line rate as well as the difference between the input pixel rate and output pixel rate.

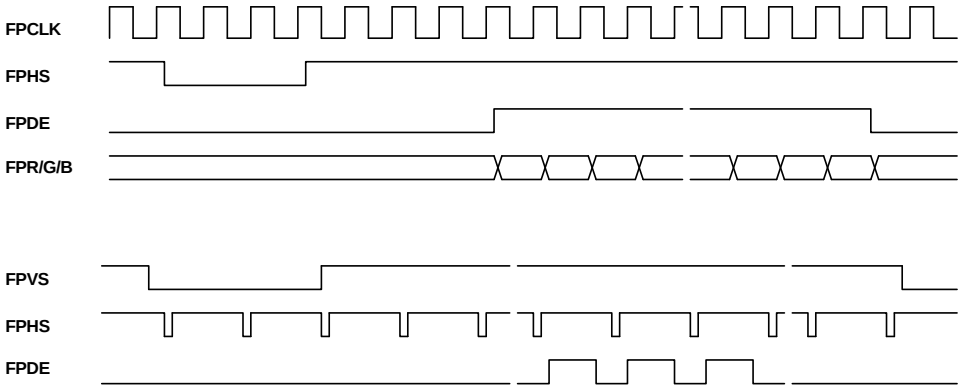

Figure 3 Flat Panel Output Signals

The frequency of the Flat Panel Clock Output pin can be controlled by an internal Spread Spectrum PLL or by an external oscillator connected to the PLLCKI pin. When the internal frequency multiplier is being used, the frequency of the Flat Panel Clock Output signal is determined by FPLL value and the post divider.

$$\text{Frequency FPCLK} = \frac{108\text{MHz} \times \text{FPLL}}{2^{17} \times 2^{\text{POST}}}$$

Color Space Conversion

The TW8817 has built-in YCbCr to RGB color space converter for the internal decoder output and the digital YCbCr input. The internal circuit will clamp the Y data value to the range of 16 to 235 for an 8-bit input. It also clamps the CbCr data value to the range of 16 to 240 in compliance with the CCIR601 standard.

On Screen Display

The TW8817 supports built-in OSD controller with integrated character ROM and programmable RAM font. The OSD display is independent of the input active window setting or the scaling ratio.

The on-chip OSD controller is a character-based controller. The pre-defined character or graphic bit map is stored in the internal ROM. There are a total of 202 built-in fonts. Each character is 12 pixels wide by 18 pixels high. The characters can be displayed on the screen in four user defined window locations of any size from 1 to 256 characters. The spaces between characters are also programmable. There is a limit of 256 characters that may be displayed on screen at one time in all windows combined. The attributes of each window can also be set to give it a shadow effect or 3-D effect. In addition, the characters can be expanded by a factor of 2,3 or 4 in vertical or horizontal directions and have the italic effect, under line effect on a character by character basis.

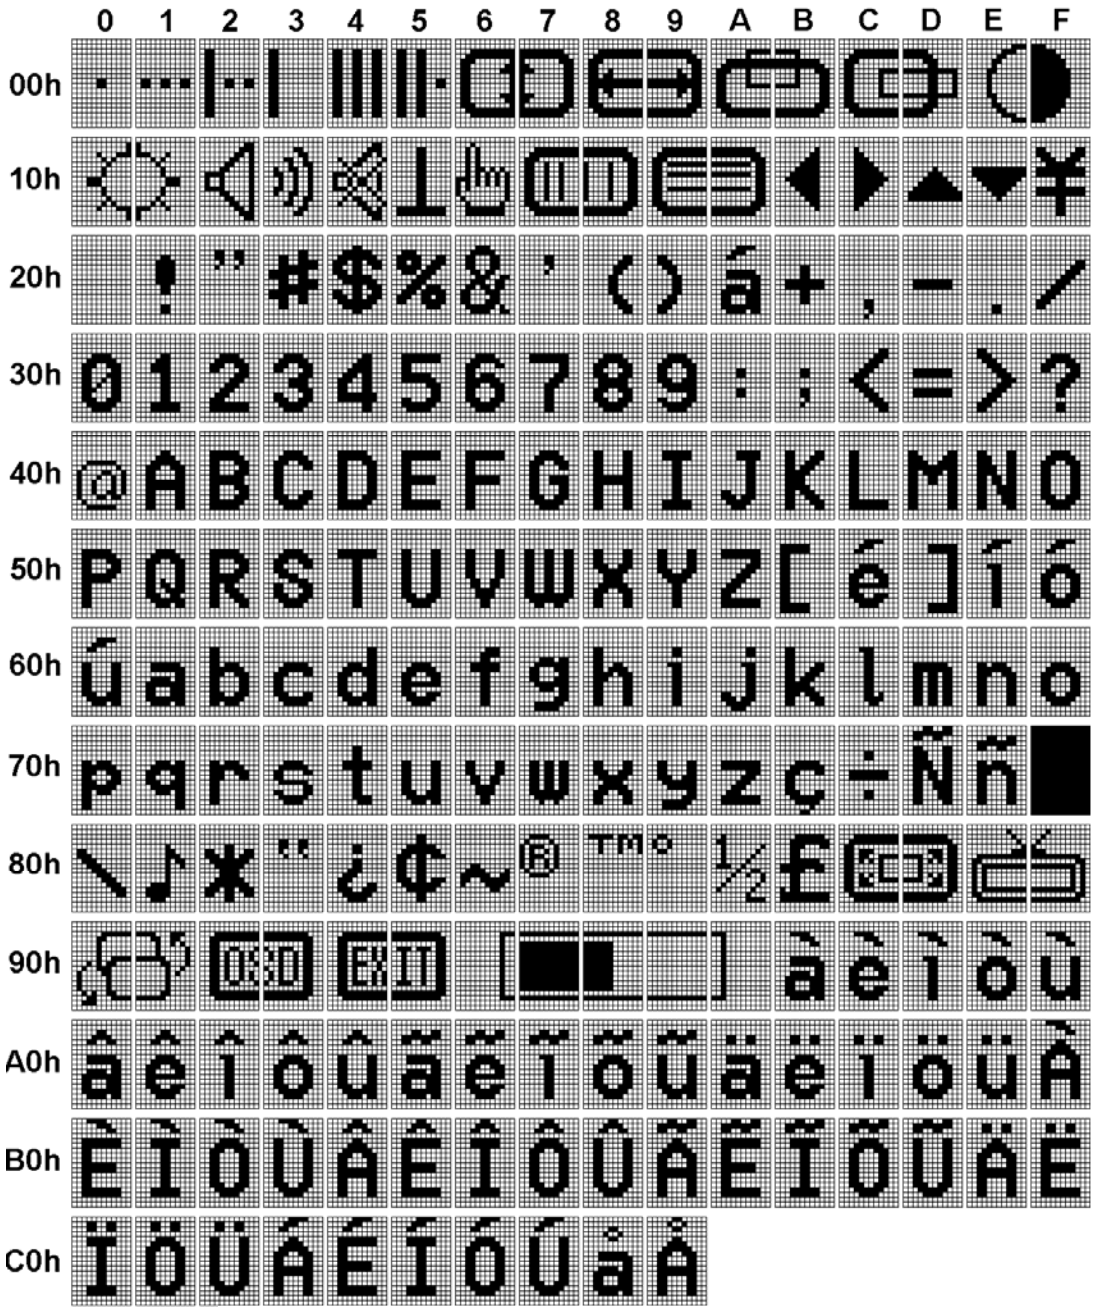

Figure 4 Font ROM Characters and Addresses

On chip OSD functions

% Font ROM : 202 Characters
- Capitalized English Alphabet, Numbers, Monitor Common Control Image, Special Alphabet Characters

% Font SRAM : Max 75 User Programmable Single Color Font or
Max 25 User Programmable Multi-ColorFont Supports (2048x8 SRAM)
Single Color / Multi-Color Fonts Combine Number : defined by user.
(Multi-Color start address can change.)

% Character Register SRAM : 256 Location (8-bit Font Address + 11-bit Character Attribute, 256x20 SRAM)

% Characters
Character Color : 16 colors
Character Background Color : 16 colors
Character Blinking : Enable/Disable, 1 Hz Blinking frequency
Character Italic Effect : Enable/Disable
Character Under Line Effect : Enable/Disable
(Multi OSD Window Display Case : Chip has a limitation)
Character Space : Both H and V programmable by number of pixels
Quick Character Change in Window : Programmable Start Address and Buffer Size
Programmable OSD Color Palette Support
Re-designed OSD Font Supporting Standard Alpha-Numerical Character Set

% Windows
Number of Windows : 4 Independent Windows
Window Color : 16 colors
Window Zoom : 2, 3, 4 times zoom by dot number, H/V separate zooming control
Window Position : Programmable
H Direction : 1-pixel per step, V Direction : 1-Line per step
Window Size : Both H and V programmable by number of characters
Window Bordering/Shadowing Effect : 4 Independent Windows Enable/Disable Control
Window Alpha Blending Control : 4 Independent Windows Control
→ 16 Different Color for Alpha Blending support(4-bit control)
Window 3-D Effect : 4 Independent Windows Enable/Disable Control
Window Border Color : 16 Colors
Window Border Width : programmable

TW8817 Basic register setting flow for Built-in OSD controller

Step_1: OSD_WINDOW_CONFIGURATION setting

1. OSD Window Select	0x09E, bit1-0
2. OSD Window Disable	0x09F, bit0
3. OSD Window Zoom multiplier	0x0A9, bit7-6: V, bit5-4:H
4. OSD Window Background B Color	0x09F, bit6-4
5. OSD Window Background G Color	0x09F, bit6-4
6. OSD Window Background R Color	0x09F, bit6-4
7. OSD Window Background Color Extension	0x09F, bit7
8. OSD Window 3-D Effect Top/Bottom Mode Select	0x09F, bit3
9. OSD Window 3-D Effect Level Select	0x09F, bit1
10. OSD Window 3-D Effect Enable/Disable 0x0	9F, bit2
11. OSD Window H-Start Location (see details in next page)	0x0A1, bit0-7 0x0A0, bit2-0
12. OSD Window V-Start Location (see details in next page)	0x0A2, bit0-7 0x0A0, bit5-4
13. OSD Window Width	0x0A3, bit0-5
14. OSD Window Height	0x0A4, bit0-5
15. OSD Window Border_Line Width	0x0A5, bit0-3
16. OSD Window Border_Line B color	0x0A5, bit4-6
17. OSD Window Border_Line G color	0x0A5, bit4-6
18. OSD Window Border_Line R color	0x0A5, bit4-6
19. OSD Window Border_Line Enable	0x0A5, bit7
20. OSD Window Border Color Extension	0x0A6, bit7
21. OSD Window Shadow Width	0x0AB, bit0-3
22. OSD Window Shadow B color	0x0AB, bit4-6
23. OSD Window Shadow G color	0x0AB, bit4-6
24. OSD Window Shadow R color	0x0AB, bit4-6
25. OSD Window Shadow Enable	0x0AB, bit7
26. OSD Window Shadow Color Extension	0x0AD, bit7
27. OSD Window H-Space Width (Between Border_line and Characters)	0x0A6, bit0-6
28. OSD Window V-Space Width (Between Border_line and Characters)	0x0A7, bit0-6
29. Character H-Space Width (Between Character and Character)	0x0A8, bit0-3 0x0AE, bit2
30. Character V-Space Width (Between Character and Character)	0x0A8, bit4-7 0x0AE, bit3
31. OSD Window Alpha Blending Color Select	0x09E, bit4-7
32. OSD Window Alpha Blending Value Control	0x0AC, bit0-3
33. Window content start address	0x096
34. Repeat 1 – 32	

Step_2: OSD_COLOR_ATTRIBUTE / FONT setting (OSD RAM)

1. Enable OSD RAM Access - 0x094 (bit0 = 0)
2. OSD RAM Address - 0x095, 0x096
   - The first address is Step_1_33 Window content start address.
3. OSD RAM Data Port High (Font Address)
   - 0x097 Data is written to above address automatically.
   - 0x094_[7] = 0 or 0x097=8'hff : FONT_ROM h00 to hC9 (202 characters)
   - 0x094_[7] = 1 or 0x097=8'hfe : FONT_RAM h00 to h4A (Max 75 characters)

4. OSD RAM Data Port Bit17(Italic Effect), Bit18(Under Line Effect)
   - 0x094 Bit6, Bit5, Bit4 Data is written to above address automatically.
5. OSD RAM Data Port Low (Color Attribute)
   - 0x098 Data is written to above address automatically.
6. Repeat 2), 3), 4), 5)
   - The address should be increased by one each.

Step_3: COLOR LOOK-UP TABLE setting

1. Select Color Look-Up Table Write Address - 0x09C (bit[3:0])
   - BIT[3:0] : These 4 bits specify one of the 16 entries in the look-up table. Each entry is indexed to a different color by its content.
   - There are 256 colors available; but only sixteen of them are accessible by OSD controller at a given time.

BIT[3:0]	Default Value
0000	00h (000,000,00)
0001	03h (000,000,11)
0010	1Ch (000,111,00)
0011	1Fh (000,111,11)
0100	E0h (111,000,00)
0101	E3h (111,000,11)
0110	FCh (111,111,00)
0111	FFh (111,111,11)
1000	49h (010,010,01)
1001	02h (000,000,10)
1010	10h (000,100,00)
1011	12h (000,100,10)
1100	80h (100,000,00)
1101	82h (100,000,10)
1110	90h (100,100,00)
1111	92h (100,100,10)

2. Color Look-Up Table control bits setting - 0x09D
   - The data of the Look-Up Table is accessed through 0x09D.
   - An index 0x09D register write strobes the data into the corresponding entry pointed by 0x09C[3:0].
   - Control BIT[7:5] → These bits assigned for R color(select one of 8 R color intensities).
   - Control BIT[4:2] → These bits assigned for G color(select one of 8 G color intensities).
   - Control BIT[1:0] → These bits assigned for B color(select one of 4 B color intensities).

R Color Table → BIT[7:5]	Table Setting Value	G Color Table → BIT[4:2]	Table Setting Value	B Color Table → BIT[1:0]	Table Setting Value
000	8'd0	000	8'd0	00	8'd0
001	8'd32	001	8'd32	01	8'd64
010	8'd64	010	8'd64	10	8'd128
011	8'd96	011	8'd96	11	8'd255
100	8'd128	100	8'd128		
101	8'd160	101	8'd160		
110	8'd192	110	8'd192		
111	8'd255	111	8'd255		

3. Repeat 1),2) to program each entry of the Look-Up Table.

Step_4: FONT_RAM_DATA setting (FONT RAM)

1. Enable FONTRAM Access - 0x094 (bit0 = 1)
2. Programmable SRAM Address Start Position Setting for Multi-Color Font.
   - 0x09B
3. FONT RAM Address Setting - 8 bits(h00 – h4A) - 0x099
   - h00~h4A : Single Font RAM(75 Programmable Characters)
   - h00~h4A : Multi-Color Font RAM(25 Programmable Characters)
     ex) 0x09B == h2D Setting Case
     → h00 ~ h2C : Single Font RAM(45 Programmable Characters)
     → h2D ~ h4A : Multi-Color Font RAM(10 Programmable Characters)
     h2D(R-color), h2E(G-color), h2F(B-color) are one set for 1 multi-color font.
4. FONT RAM Data Port
   - 0x09A Data is written to above address automatically.
5. Repeat (4) at 27 times for one FONT RAM Data
   - the internal address automatically increases by one each.
6. New FONT RAM Address Setting – 8 bits
7. Repeat 3),4),5)
   - The FONT RAM Address should be increased by one each.

Note) As for the FONT RAM configuration and font bit mapping, see the detailed description

Step_5: End of OSD setting and Enable OSD

1. Disable OSD RAM / FONT RAM Access - 0x094 (bit0 = 0)
2. OSD Window Enable - 0x09E bit[1:0] window select
   → 000: Window1, 001: Window2, 010: Window3, 011: Window4
   - bit0 = 1 of 0x09F

OSD Window Start Location : Built-in OSD controller

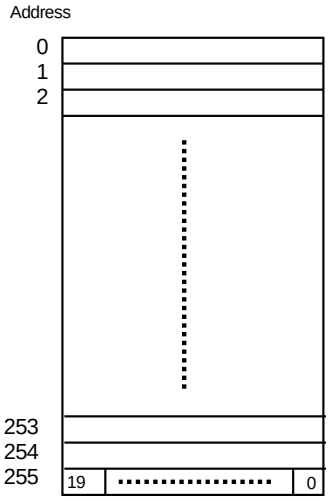
OSD window H_start location (N): 0x09E bit[1:0] window select, 0x0A2,0A0 increment by 1 at a time
N = 0, 1, 2, 3… Pixel 1 when N = 0,1

N	OSD_Window Start_Pixel
1	pixel 1 (begin with pixel 1)
2	pixel 2
3	pixel 3
N	pixel N

OSD window V_start location (M) : 0x09E bit[1:0] window select, 0x0A2,0A1 increment by 1 at a time
M = 0, 1, 2, 3.... Line 1 when M = 0,1

M	OSD_Window Start_Line
1	line 1 (begin with line 1)
2	line 2
3	line 3
M	line M

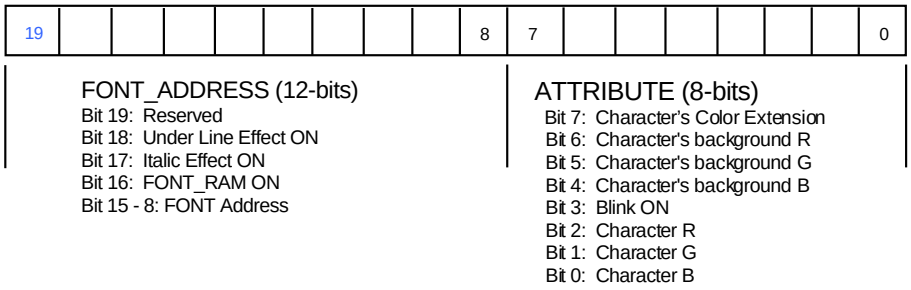
OSD_RAM Configuration



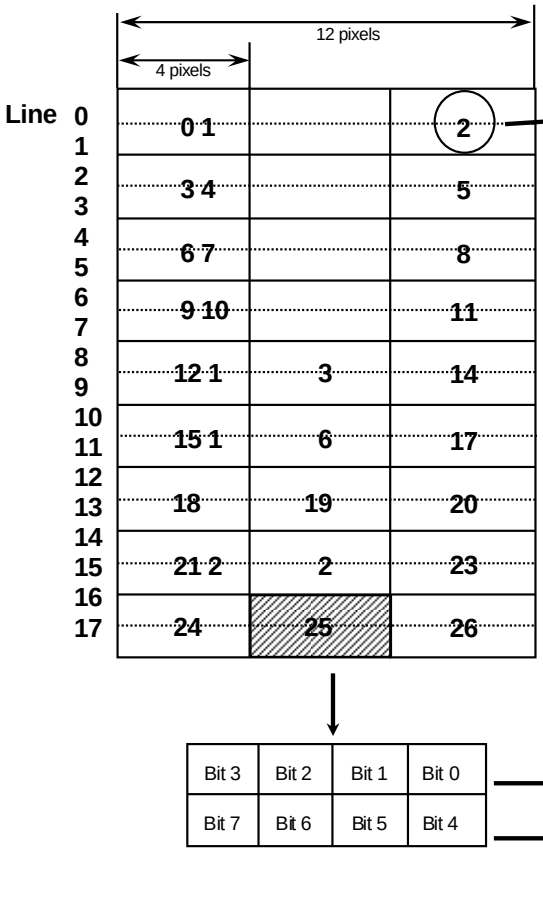
The characters can be displayed on the screen in four user defined window locations of any size from 1 to 256 characters. There is a limit of 256 characters that may be displayed on screen at one time in all windows combined.

Example

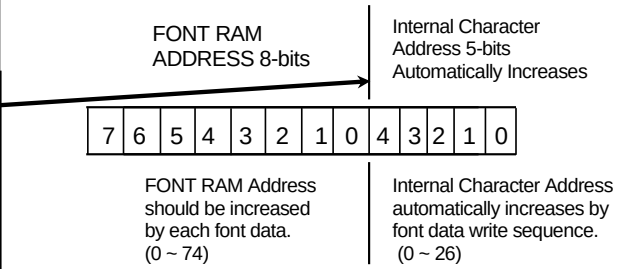
Window #1: Address 0 – 2 (3 characters)
Window #2: Address 3 – 100 (98 characters)
Window #3: Address 101– 254 (154 characters)
Window #4: Address 255 (1 character)



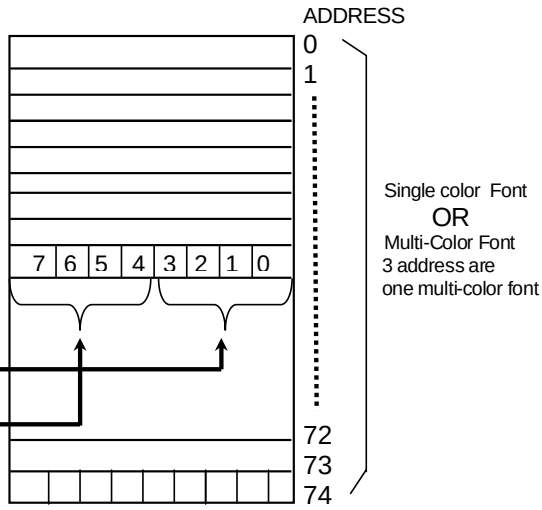
FONT BIT MAP 12 x 18 dots = 1 character



FONT RAM ADDRESS 7-bits



FONT RAM (2048 x 8 bits)



TW8817 Alpha Blending for OSD Window

The TW8817 uses "Alpha Blending" in OSD 4 separation windows & 16 separation colors. Alpha blending mixes (adds) the video signal and OSD signal at the following specified levels. In other words, alpha blending determines the transparency of the OSD window each color to in relation to video signal. When alpha blending is disabled, only OSD data is displayed in OSD window.
The alpha blending level selection are 4-bit assigned, it can support 8 different level control.

The alpha blending level bits and alpha blending color selection bits are in register 0x09E, 0x0AC for each windows(Window Control by register 0X9E bit[1:0]).

alpha[3:0]	Video Level
0000	0.00 %
0001	1 2.5
0010	2 5.0
0011	3 7.5
0100	5 0.0
0101	6 2.5

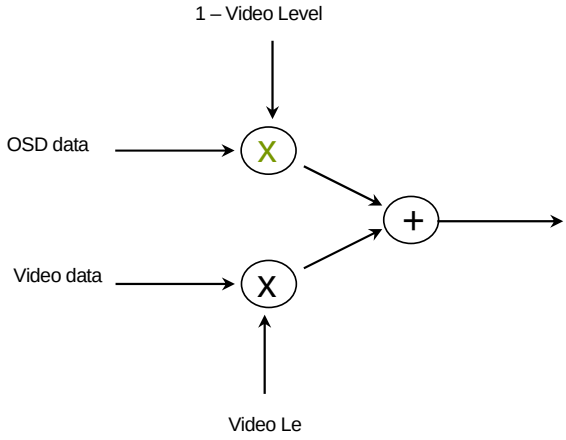
Alpha Blending Concept :



Microcontroller Interface

The TW8817 registers are accessed via 2-wire serial bus interface. It operates as a slave device. Serial clock and data lines transfer data from the bus master at a rate up to 400 Kb/s.

Built-in Microcontroller

TW8817 has built-in microcontroller which supports several interface.

- Support external SPI Interface.
- Support I2C Master interface with GPIO { Port 1.0 SCL, Port 1.1 SDA}.
- Support up to 8 MCU GPIO { Port 2.0 GP0 ~ Port 2.7 GP7}.
- Support UART interface with GPIO { Port 3.0 RXD, Port 3.1 TXD}.
- Support IR or interrupt with GPIO { Port3.2 IR}.

Power Management

The TW8817 supports panel power sequencing. Typical TFT panels require different parts of the panel power to be applied in the right sequence to avoid premature damage to the panel. Pins are provided to control the panel backlight generator, digital circuitry and panel driver, separately. The TW8817 controls the power up and power down sequence for the LCD panels. The time lapses between different stages of the sequence are independently programmable to meet various power sequencing requirements.

The TW8817 also supports VESA™ DPMS for monitor power management. It can detect the DPMS status from input sync signals and automatically change into On/Off mode. To support the power management, the TW8817 has three operating modes: Power On mode, Power Off mode, and Panel Off mode. All the DPMS power saving mode will be covered by the Power Off mode.

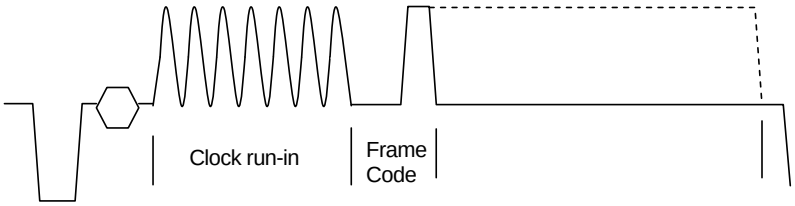


Figure 5 Typical CC/EDS scan line waveform

Closed Captioning and Extended Data Services

Closed Caption (CC) vertical blanking interval scan lines are on the odd field NTSC line 21. Extended Data Services (EDS) scan lines are on the even field NTSC line. A Closed Caption (CC) scan line on an NTSC-based system is made of 25 bit periods at a 0.503MHz rate. The data is an analog signal beginning with a packet header. It contains a Clock Synchronization Code consisting of 14 bits of double-frequency run-in clock at 1.006 MHz, a 2-bit framing code. The data of 16 bits/2 bytes follows the packet header. Each of these 2 bytes is a 7 bit + odd parity ASCII character which represents text or control characters for positioning or display control. For the purposes of CC or EDS, only the Y component of the video signal is used. Therefore, the input composite video has to go through the Y/C separation to extract Y component for further decoding. The TW8817 can be programmed to decode CC or EDS data by setting register 0x1B. Since the CC and EDS are independent, there could be one or both in a particular frame. A typical waveform is shown in Figure 5.

In the CC/EDS decode mode, the decoder monitors the appropriate scan lines looking for the clock run-in and start bits pattern. It found, it locks to the clock run-in, the caption data is sampled and loaded into shift registers, and the data is then transferred to the caption data FIFO. The TW8817 provides a 16 x 10 location FIFO for storing CC/EDS data. Once the video decoder detects the start signal in the CC/EDS signal, it captures the low byte of CC/EDS data first and checks to see if the FIFO is full. If the FIFO is not full, then the data is stored in the FIFO, and is available to the user through the CC_DATA register (0x1A). The high byte of CC/EDS data is captured next and placed in the FIFO. Upon being placed in the 10-bit FIFO, two additional bits are attached to the CC/EDS data byte by TW8817's CC/EDS decoder. These two bits indicate whether the given byte stored in the FIFO corresponds to CC or EDS data and whether it is the high or low byte of CC/EDS. These two bits are available to the user through the CC_STATUS register bits CC_EDS and LO_HI, respectively. As stored in the FIFO, LO_HI is bit 8 and CC_EDS is bit 9. Additionally, the TW8817 stores the results of the parity check in the PARITY_ERR bit in the CC_STATUS register.

The 16-location FIFO can hold eight lines worth of CC/EDS data, at two bytes per line. Initially when the FIFO is empty, bit Empty in the CC_STATUS register (0x1A) is set low and indicates that no data is available in the FIFO. Subsequently, when data has been stored in the FIFO, the Empty bit is set to logical high. Once the FIFO is half full, the CC_VALID interrupt pin signals to the system that the FIFO contents should be read in the near future. The CCVALID bit is enabled via a bit in the CC_STATUS register (0x1A). The system controller can then poll the CCVALID bit in the STATUS register (0x00) to ensure that it was the TW8817 that initiated the CCVALID interrupt.

When the first byte of CC/EDS data is decoded and stored in the FIFO, the data is immediately placed in the CC_DATA and CC_STATUS registers and is available to be read. Once the data is read from the CC_DATA register, the information in the next location of the FIFO is placed in the CC_DATA and CC_STATUS registers. If the controller in the system ignores TW8817's CCVALID bit for a sufficiently long period of time, then the CC/EDS FIFO will become full and the TW8817 will not be able to write additional data to the FIFO. Any incoming bytes of data will be lost and an overflow condition will occur; bit Overflow in the CC_STATUS register will be set to a logical one. The system may clear the overflow condition by reading the CC/EDS data and creating space in the FIFO for new information. As a result, the overflow bit is reset to a logical zero.

There will routinely be asynchronous reads and writes to the CC/EDS FIFO. The writes will be from the CC/EDS circuitry and the reads will occur as the system controller reads the CC/EDS data from TW8817. These reads and writes will sometimes occur simultaneously, and the TW8817 is designed to give priority to the read operations. In the case where the CC_DATA register data is specifically being read to clear an overflow condition, the simultaneous occurrence of a read and a write will not cause the overflow bit to be reset, even though the read has priority. An additional read must be made to the CC_DATA register in order to clear the overflow condition. As always, the write data will be lost while the FIFO is in overflow condition.

Two Wire Serial Bus Interface

Deleted: The FIFO is reset when both CC and EDS bits are disabled in the CC_STATUS register; any data in the FIFO is lost.¶

The two wire serial bus interface is used to allow an external micro-controller to write control data to, and read control or other information from the TW8817 registers. SCLK is the serial clock and SDAT is the data line. Both lines are pulled high by resistors connected to VDD. ICs communicate on the bus by pulling SCLK and SDAT low through open drain outputs. In normal operation the master generates all clock pulses, but control of the SDAT line alternates back and forth between the master and the slave. For

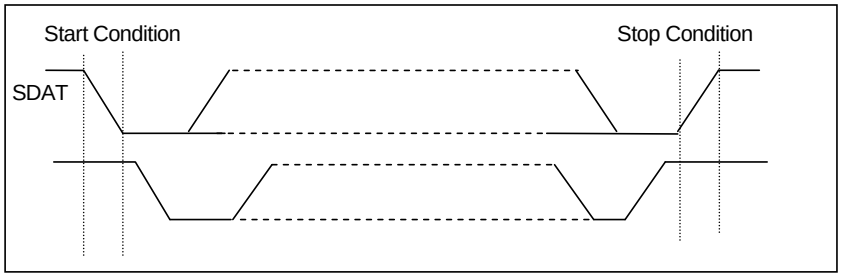

Figure 6 Definition of two-wire serial bus interface bus start and stop

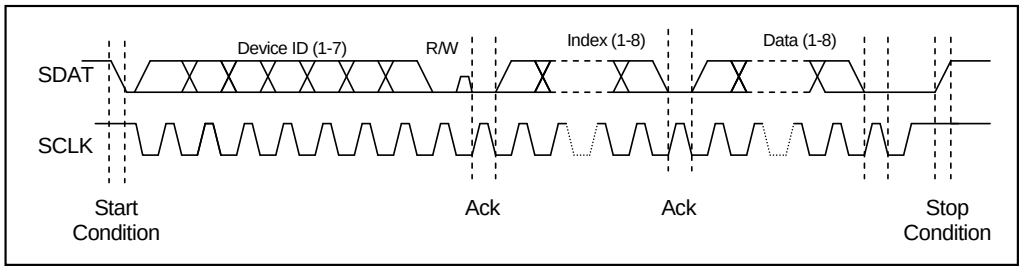

Figure 7 One complete serial bus interface register write sequence

both read and write, each byte is transferred MSB first, and the data bit is valid whenever SCLK is high.

The TW8817 is operated as a bus slave device. The most significant 7-bits are fixed. The 7-bit address field is concatenated with the read/write control bit to form the first byte transferred during a new transfer. If the read/write control bit is high the next byte will be read from the slave device. If it is low the next byte will be a write to the slave. When a bus master (the host microprocessor) drives SDAT from high to low, while SCLK is high, this is defined to be a start condition (See Figure 6.). All slaves on the bus listen to determine when a start condition has been asserted.

After a start condition, all slave devices listen for their device addresses. The host then sends a byte consisting of the 7-bit slave device ID and the R/W bit. This is shown in Figure 7. (For the TW8817, the next byte is normally the index to the TW8817 registers and is a write to the TW8817 therefore the first R/W bit is normally low.)

After transmitting the device address and the R/W bit, the master must release the SDAT line while holding SCLK low, and wait for an acknowledgement from the slave. If the address matches the device address of a slave, the slave will respond by driving the SDAT line low to acknowledge the condition. The master will then continue with the next 8-bit transfer. If no device on the bus responds, the master transmits a stop condition and ends the cycle. Notice that a successful transfer always includes nine clock pulses.

To write to the internal register of the TW8817, the master sends another 8-bits of data, the TW8817 loads this to the register pointed by the internal index register. The TW8817 will acknowledge the 8-bit data transfer and automatically increment the index in preparation for the next data. The master can do multiple writes to the TW8817 if they are in ascending sequential order. After each 8-bit transfer the TW8817 will acknowledge the receipt of the 8-bits with an acknowledge pulse. To end all transfers to the TW8817 the host will issue a stop condition.

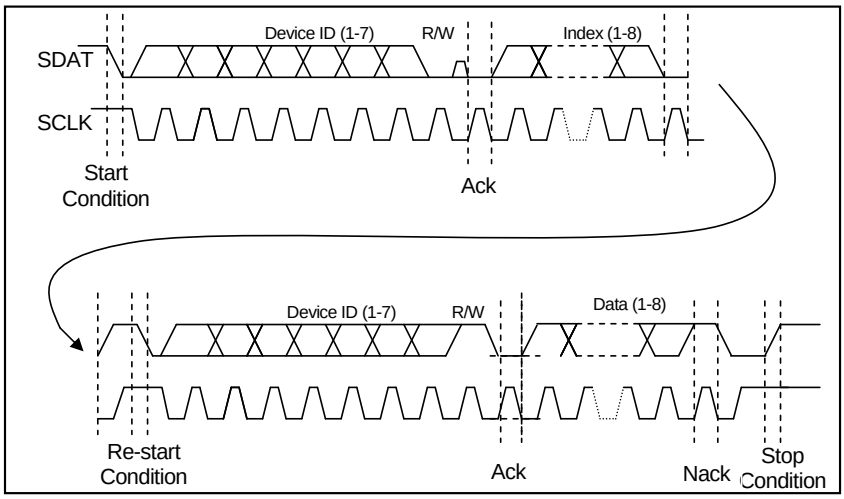

Figure 8 One complete serial bus interface register read sequence

Table 2 TW8817 serial bus interface 7-bit slave address and read write bit

Serial Bus Interface 7-bit Slave Address							Read/Write bit
1	0 0 0			1	0	1	1= Read 0=Write

A TW8817 read cycle has two phases. The first phase is a write to the internal index register. The second phase is the read from the data register. (See figure 8). The host initiates the first phase by sending the start condition. It then sends the slave device ID together with a 0 in the R/W bit position. The index is then sent followed by either a stop condition or a second start condition. The second phase starts with the second start condition. The master then resends the same slave device ID with a 1 in the R/W bit position to indicate a read. The slave will transfer the contents of the desired register. The master remains in control of the clock. After transferring eight bits, the slave releases. The master takes control of the SDAT line and acknowledges the receipt of data to the slave. To terminate the last transfer the master will issue a negative acknowledge (SDAT is left high during a clock pulse) and issue a stop condition.

The TW8817 contains more than 256 index registers. Since the index data for serial bus access is only eight bits wide, a page mechanism is used to access these registers. The bit 0 of index 0xFF is used to select either the first page of 255 registers or the second page of 255 registers. In the register map, the index consists of 9 bits. The MSB denotes the content of bit 0 of index 0xFF, and the rest 8 bits correspond to the serial bus index data. Hence 0x000 denotes the index 0 of page 0, while 0x100 denotes the index 0 of page 1. Index 0xFF is shared between page 0 and page 1.

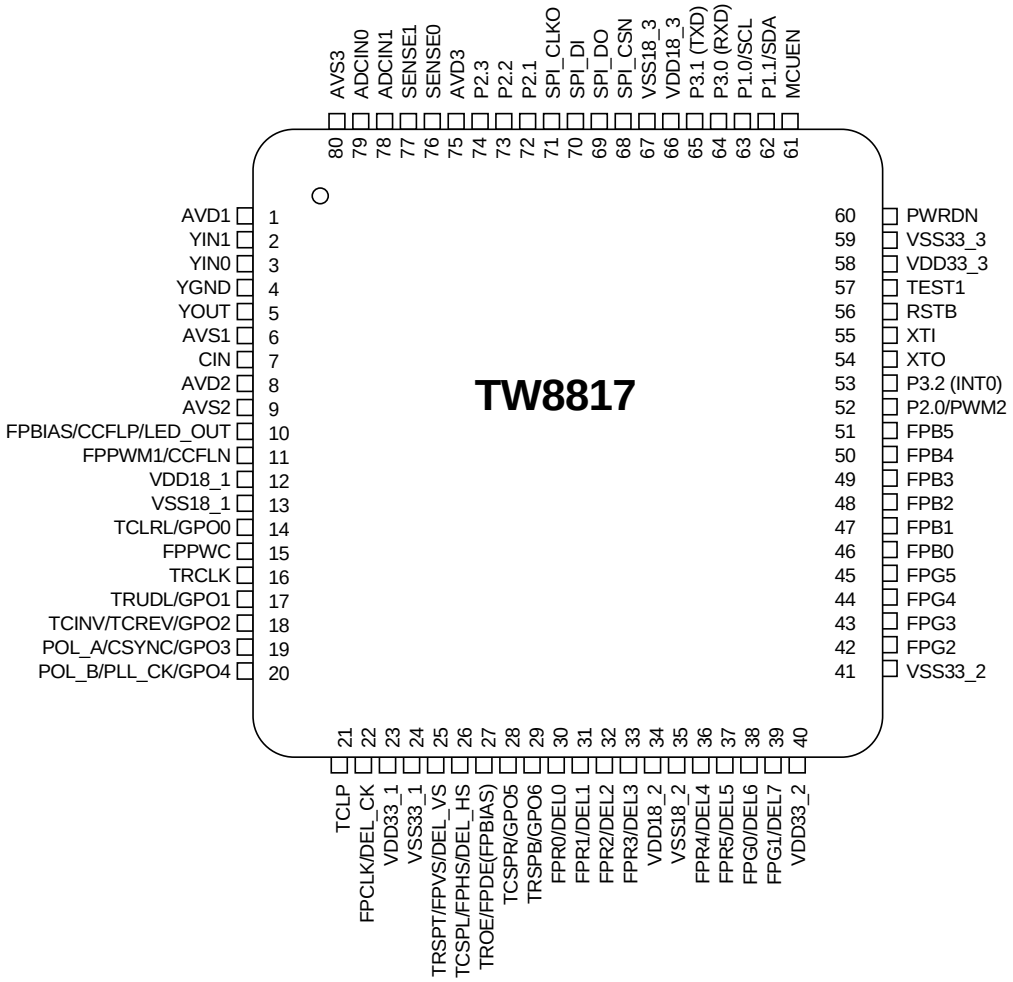
Test Modes

The TEST1 input pin provides test mode selection. If this pin is low at the rising edge of the RESET# pin and remains low, the TW8817 is in its normal operating mode. Table 3 shows the other test modes made available with this pin.

Table 3 Test modes

Test mode	TEST1 Before RESET# rising edge	TEST1 After RESET# rising edge	Description
Normal 0		0	Normal operation
Output tri-state	0	1	In this mode, all pin output drivers are tri-stated. Pin leakage current parameters can be measured.
Outputs high	1	0	In this mode, all pin output drivers are forced to the high output state. V_{OH} and I_{OH} can be measured.
Outputs low	1	1	In this mode, all pin output drivers are forced to the low output state. V_{OL} and I_{OL} can be measured.

TW8817 Package Pin Diagram



Pin Description

This section provides a detailed description of each pin for the TW8817. The pins are arranged in functional groups according to their associated interface.

The active state of the signal is determined by the trailing symbol at the end of the signal name. A "#" symbol indicates that the signal is active or asserted at a low voltage level. When "#" is not present after the signal name, the signal is active at the high voltage level.

The pin description also includes the buffer direction and type used for that pin.

PIN #	I/O	Name	Description	Recommended Connection of Unused Pins
Analog I/F signals				
1	P	AVD1	Analog VDD +1.8V	
2	A	YIN1	Analog composite or luma input 1	Connect to Analog Ground
3	A	YIN0	Analog composite or luma input 0	Connect to Analog Ground

Parametric Information

AC/DC Electrical Parameters

Table 4. Absolute Maximum Ratings

Parameter S	ymbol	Min	Typ	Max	Units
AVD1, AVD2(measured to AVS1, AVS2)	V_{DDAM} -		-	1.92	V
AVD3 (measured to AVS3)	V_{DDA33M} -		-	3.6	V
VDD18 (measured to VSS18)	V_{DDM} -		-	1.98	V
VDD33 (measured to VSS33)	V_{DDEM} -		-	3.6	V
Voltage on any digital signal pin (See the note below)	-	VSS33 – 0.5	- 5.	5	V
Analog Input Voltage (supplied by 1.8V)	-	AVSS – 0.5	- 1	.92	V
Analog Input Voltage (supplied by 3.3V)	-	AVSS33 – 0.5	- 3.	6	V
Storage Temperature	T_{S} –6	5	-	+150	°C
Junction Temperature	T_{J} -		-	+125	°C
Vapor Phase Soldering(15 Seconds)	T_{VSOL} -		-	+220	°C

NOTE: Stresses above those listed may cause permanent damage to the device. This is a stress rating only, and functional operation at these or any other conditions above those listed in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

This device employs high-impedance CMOS devices on all signal pins. It must be handled as an ESD-sensitive device. Voltage on any signal pin that exceeds the ranges list in Table 4 can induce destructive latch-up.

Note:

1. Dimension of D1 and E1 do not include mold protrusion. Allowable protrusion is 0.25mm per side. Dimension D1 and E1 are maximum plastic body size dimensions including mold mismatch.

2. Dimension b does not include dambar protrusion. Allowable dambar protrusion shall not cause the lead width to exceed. Dambar cannot be located on the lower radius or the lead root.

3. Controlling dimension : Millimeter.

4. A1 is defined as the distance from the seating plane to the lowest point of the package body.

TW8817 Register Summary

The registers are organized in functional groups in this Register Summary. A register containing different functional bits may appear more than once in different functional groups. If a particular bit of a register is not related to that functional group, it is printed in smaller font than those related. For example, bit 7 of index 006 is classified as "General" and is printed in normal size; the other bits in this register are printed in smaller size for their functionality is not classified as "General".

0x000 – Product ID Code Register (ID)

Bit	Function	R/W	Description	Reset
7-3	ID	R	The TW8817 Product ID code is 01001.	01001b
2-0	Revision	R	Revision number	001b

0x001 – Chip Status Register (CSTATUS)

Bit	Function	R/W	Description	Reset
7	VDLOSS	R	1 = Video not present. (sync is not detected in number of consecutive line periods specified by MISSCNT register) 0 = Video detected.	0
6	HLOCK	R	1 = Horizontal sync PLL is locked to the incoming video source. 0 = Horizontal sync PLL is not locked.	0
5	SLOCK	R	1 = Sub-carrier PLL is locked to the incoming video source. 0 = Sub-carrier PLL is not locked.	0
4	FIELD	R	0 = Odd field is being decoded. 1 = Even field is being decoded.	0
3	VLOCK	R	1 = Vertical logic is locked to the incoming video source. 0 = Vertical logic is not locked.	0
2	*Reserved*	R	Reserved	0
1	MONO	R	1 = No color burst signal detected. 0 = Color burst signal detected.	0
0	DET50	R	0 = 60Hz source detected 1 = 50Hz source detected The actual vertical scanning frequency depends on the current standard invoked.	0

0x002 – Input Format (INFORM)

Bit	Function	R/W	Description	Reset
7	Reserved	R/W	Reserved	0
6	FC27	R/W	1 = Input crystal clock frequency is 27MHz. 0 = Square pixel mode. Must use 24.54MHz for 60Hz field rate source or 29.5MHz for 50Hz field rate source.	1
5-4	IFSEL	R/W	11 = Component video decoding (Progressive input) 10 = Component video decoding (Interlace input) 01 = S-video decoding 00 = Composite video decoding	00
3-2	YSEL[1:0]	R/W	These three bits control the input video selection. It selects the composite video source or luma source. 00 : YOUT = YIN0 01 : YOUT = YIN1 10 : YOUT = YIN2 (CIN) 11 : Not exist	00
1	Reserved	R/W	Reserved	0
0	Reserved	R/W	Reserved	0

0x003 – Reserved

Bit	Function	R/W	Description	Reset
7-0	Reserved	R/W	Reserved	-

0x004 – HSYNC Delay Control

Deleted: and HSYNC Delay Control

Bit	Function	R/W	Description	Reset
7	Reserved	R/W	Reserved	0
6-5	CKHY	R/W	Color killer time constant 0: fast 3: slow	0
4-0	Reserved	R/W	Reserved	0

0x005 – Reserved

Bit	Function	R/W	Description	Reset
7-0	Reserved	R/W	Reserved	-

0x006 – Analog Control Register (ACNTL)

Bit	Function	R/W	Description	Reset
7	SRESET	W	A 1 written to this bit resets the device to its default state but all register content remain unchanged. This bit is self-resetting.	0
6	PDYBF	R/W	0 = Power down Y + C output buffer 1 = Power down (default)	1
5	VREF	R/W	0 = Internal voltage reference. 1 = Internal voltage reference shut down.	0
4	AGC_EN	R/W	0 = AGC loop function enabled. 1 = AGC loop function disabled. Gain is set to by AGCGAIN.	0
3	CLK_PDN	R/W	0 = Normal clock operation. 1 = 27 MHz clock in power down mode.	0
2	Y_PDN	R/W	0 = Luma ADC in normal operation. 1 = Luma ADC in power down mode.	0
1	C_PDN	R/W	0 = Chroma ADC in normal operation. 1 = Chroma ADC in power down mode.	0
0	V_PDN	R/W	0 = V channel ADC in normal operation. 1 = V channel ADC in power down mode.	0

0x007 – Cropping Register, High (CROP_HI)

Bit	Function	R/W	Description	Reset
7-6	VDELAY_HI	R/W	These bits are bit 9 to 8 of the 10-bit Vertical Delay register.	00
5-4	VACTIVE_HI	R/W	These bits are bit 9 to 8 of the 10-bit VACTIVE register. Refer to description on Reg09 for its shadow register.	01
3-2	HDELAY_HI	R/W	These bits are bit 9 to 8 of the 10-bit Horizontal Delay register.	00
1-0	HACTIVE_HI	R/W	These bits are bit 9 to 8 of the 10-bit HACTIVE register.	10

0x008 – Vertical Delay Register, Low (VDELAY_LO)

Bit	Function	R/W	Description	Reset
7-0	VDELAY_LO	R/W	These bits are bit 7 to 0 of the 10-bit Vertical Delay register. The two MSBs are in the CROP_HI register. It defines the number of lines between the leading edge of VSYNC and the start of the active video.	12h

0x009 – Vertical Active Register, Low (VACTIVE_LO)

Bit	Function	R/W	Description	Reset
7-0	VACTIVE_LO	R/W	These bits are bit 7 to 0 of the 10-bit Vertical Active register. The two MSBs are in the CROP_HI register. It defines the number of active video lines per frame output. The VACTIVE register has a shadow register for use with 50Hz source when Atreg of Reg0x1C is not set. This register can be accessed through the same index address by first changing the format standard to any 50Hz standard.	20h

0x00A – Horizontal Delay Register, Low (HDELAY_LO)

Bit	Function	R/W	Description	Reset
7-0	HDELAY_LO	R/W	These bits are bit 7 to 0 of the 10-bit Horizontal Delay register. The two MSBs are in the CROP_HI register. It defines the number of pixels between the leading edge of the HSYNC and the start of the image cropping for active video. The HDELAY_LO register has two shadow registers for use with PAL and SECAM sources respectively. These register can be accessed using the same index address by first changing the decoding format to the corresponding standard.	10h

0x00B – Horizontal Active Register, Low (HACTIVE_LO)

Bit	Function	R/W	Description	Reset
7-0	HACTIVE_LO	R/W	These bits are bit 7 to 0 of the 10-bit Horizontal Active register. The two MSBs are in the CROP_HI register. It defines the number of active pixels per line output.	D0h

0x00C – Control Register I (CNTRL1)

Bit	Function	R/W	Description	Reset
7	PBW	R/W	Combined with VTL[3], there are four different chroma bandwidth can be selected. 1 = Wide Chroma BPF BW 0 = Normal Chroma BPF BW	1
6	DEM	R/W	Color killer sensitivity. 1= low 0 = high	1
5	PALSW	R/W	1 = PAL switch sensitivity low. 0 = PAL switch sensitivity normal.	0
4	SET7	R/W	1 = The black level is 7.5 IRE above the blank level. 0 = The black level is the same as the blank level.	0
3	COMB	R/W	1 = Adaptive comb filter on for NTSC/PAL 0 = Notch filter	1
2	HCOMP	R/W	1 = Operation mode 1. (recommended) 0 = Operation mode 0.	1
1	YCOMB	R/W	This bit controls the comb operation when there is no color burst. 1 = No comb. 0 = comb.	0
0	PDLY	R/W	PAL delay line. 0 = enabled. 1 = disabled.	0

Deleted: 0x0D – Vertical Scaling Register, Low (VSCALE_LO)¶
Bit ... [1]

0x00D – CC Control

Bit	Function	R/W	Description	Reset
7-6	Reserved	R/W	Reserved	
5	WSSEN	R/W	1 = Enable WSS decoding. 0 = Disabled.	
4-0	CCODDLINE	R/W	These bits control the Closed Caption decoding line number in case of odd field	15h

0x00E – WSS1

Bit	Function	R/W	Description	Reset
7	CRCERR	R	This is the CRC error indicator for 525-line WSS. 1:CRC error.0:no error	-
6	WSSFLD	R	These bit indicates the detected WSS field information, 0=odd and 1=even.	-
5-0	WSS1	R	These bits represent the sliced WSS data bit 13 to 8.	-

0x00F – WSS2

Bit	Function	R/W	Description	Reset
7-0	WSS2	R	These bits represent the sliced WSS bit 7 to 0.	-

0x010 – BRIGHTNESS Control Register (BRIGHT)

Bit	Function	R/W	Description	Reset
7-0	Brightness	R/W	These bits control the brightness. They have value of –128 to 127 in 2's complement form. Positive value increases brightness. A value 0 has no effect on the data.	00h

Deleted: 0x0F – Horizontal Scaling Register, Low (HSCALE_LO)¶

0x011 – CONTRAST Control Register (CONTRAST)

Bit	Function	R/W	Description	Reset
7-0	Contrast	R/W	These bits control the contrast. They have value of 0 to 3.98 (FFh). A value of 1 (`100_0000`) has no effect on the video data.	5Ch

0x012 – SHARPNESS Control Register I (SHARPNESS)

Bit	Function	R/W	Description	Reset
7	SCURVE	R/W	This bit controls the center frequency of the peaking filter. The corresponding gain adjustment is HFLT. 0 = low 1 = center	0
6	VSF	R/W	This bit is for internal used.	0
5-4	CTI	R/W	Color transient improvement level control. There are 4 enhancement levels with 0 being the lowest and 3 being the highest.	1
3-0	SHARP	R/W	These bits control the amount of sharpness enhancement on the luminance signals. There are 16 levels of control with '0' having no effect on the output image and '15' being the strongest.	1

0x013 – Chroma (U) Gain Register (SAT_U)

Bit	Function	R/W	Description	Reset
7-0	SAT_U	R/W	These bits control the digital gain adjustment to the U (or Cb) component of the digital video signal. The color saturation can be adjusted by adjusting the U and V color gain components by the same amount in the normal situation. The U and V can also be adjusted independently to provide greater flexibility. The range of adjustment is 0 to 200%.	80h

0x014 – Chroma (V) Gain Register (SAT_V)

Bit	Function	R/W	Description	Reset
7-0	SAT_V	R/W	These bits control the digital gain adjustment to the V (or Cr) component of the digital video signal. The color saturation can be adjusted by adjusting the U and V color gain components by the same amount in the normal situation. The U and V can also be adjusted independently to provide greater flexibility. The range of adjustment is 0 to 200%.	80h

0x015 – Hue Control Register (HUE)

Bit	Function	R/W	Description	Reset
7-0	HUE	R/W	These bits control the color hue. It is in 2's complement form with 0 being the center value. Positive value results in red hue and negative value gives green hue.	00h

0x017 – Vertical Peaking Control I

Bit	Function	R/W	Description	Reset
7-4	SHCOR	R/W	These bits provide coring function for the sharpness control.	3h
3	Reserved	R/W	Reserved	0
2-0	VSHP	R/W	Vertical peaking gain control	0

0x018 – Coring Control Register (CORING)

Bit	Function	R/W	Description	Reset
7-6	CTCOR	R/W	These bits control the coring function for the CTI. It has internal step size of 2.	1h
5-4	CCOR	R/W	These bits control the low level coring function for the Cb/Cr output.	0h
3-2	VCOR	R/W	These bits control the coring function of the vertical peaking logic. It has an internal step size of 2.	1h
1-0	CIF	R/W	These bits control the IF compensation level. 0 = None 1 = 1.5 dB 2 = 3 dB 3 = 6 dB	0h

0x019 – Delta RGB Mode and ADC Control Register

Bit	Function	R/W	Description	Reset
7	Reserved	R/W	Reserved	0
6	DELTA_N	R/W	Delta RGB Mode Enable	0
4	INREFI	R/W	ADC Bias Current Control (0 = Normal)	0
3	INREFV	R/W	ADC Voltage Reference (0 = Normal)	0
2	SAVE	R/W	ADC Reduce Supply Current (1 = Save)	0
1-0	Reserved	R/W	Reserved	0

Deleted:

0x01A – CC/EDS Status Register (CC_STATUS)

Bit	Function	R/W	Description	Reset
7	CCV ALIDEN	R/W		0
6	EDS_EN	R/W	0 = EDS data is not transferred to the CC_DATA FIFO. 1 = EDS data is transferred to the CC_DATA FIFO.	0
5	CC_EN	R/W	0 = CC data is not transferred to the CC_DATA FIFO. 1 = CC data is transferred to the CC_DATA FIFO.	0
4	PARITY	R	0 = Data in CC_DATA has no error. 1 = Data in CC_DATA has odd parity error.	-
3	FF_OVF	R	0 = An overflow has not occurred. 1 = An overflow has occurred in the CC_DATA FIFO.	-
2	FF_EMP	R	0 = CC_DATA FIFO is empty. 1 = CC_DATA FIFO has data available.	-
1	CC_EDS	R	0 = Closed caption data is in CC_DATA register. 1 = Extended data service data is in CC_DATA register.	-
0	LO_HI	R	0 = Low byte of the 16-bit word is in the CC_DATA register. 1 = High byte of the 16-bit word is in the CC_DATA register.	-

0x01B – CC/EDS Data Register (CC_DATA)

Bit	Function	R/W	Description	Reset
7-0	CC Data	R	These bits store the incoming closed caption or even field closed caption data.	-

0x01C – Standard Selection (SDT)

Bit	Function	R/W	Description	Reset
7	DETSTUS	R	0 = Idle 1 = detection in progress	0
6-4	STDNOW	R	Current standard invoked 0 = NTSC(M) 1 = PAL (B,D,G,H,I) 2 = SECAM 3 = NTSC4.43 4 = PAL (M) 5 = PAL (CN) 6 = PAL 60 7 = Not valid	0
3	ATREG	R/W	1 = Disable the shadow registers. 0 = Enable VACTIVE and HDELAY shadow registers value depending on standard	1
2-0	Standard	R/W	Standard selection 0 = NTSC(M) 1 = PAL (B,D,G,H,I) 2 = SECAM 3 = NTSC4.43 4 = PAL (M) 5 = PAL (CN) 6 = PAL 60 7 = Auto detection	7h

0x01D – Standard Recognition (SDTR)

Bit	Function	R/W	Description	Reset
7	ATSTART	R/W	Writing 1 to this bit will manually initiate the auto format detection process. This bit is a self-resetting bit.	0
6	PAL6_EN	R/W	1 = enable recognition of PAL60. 0 = disable recognition.	1
5	PALN_EN	R/W	1 = enable recognition of PAL (CN). 0 = disable recognition.	1
4	PALM_EN	R/W	1 = enable recognition of PAL (M). 0 = disable recognition.	1
3	NT44_EN	R/W	1 = enable recognition of NTSC 4.43. 0 = disable recognition.	1
2	SEC_EN	R/W	1 = enable recognition of SECAM. 0 = disable recognition.	1
1	PALB_EN	R/W	1 = enable recognition of PAL (B,D,G,H,I). 0 = disable recognition.	1
0	NTSC_EN	R/W	1 = enable recognition of NTSC (M). 0 = disable recognition.	1

0x01E – Component Video Format (CVFMT)

Bit	Name	R/W	Description	Reset
7	RSV	R	Reserved	0
6-4	CVSTD	R	Component video input format detection. 0 = 480i, 1 = 576i, 2 = 480p, 3 = 576p	0h
3-0	CVFMT	R/W	Component video format selection. 0 = 480i, 1 = 576i, 2 = 480p, 3 = 576p, 8 = Auto	8h

0x01F – Test Control Register (TEST)

Deleted: 0x19 – VBI Control Register (VBICNTL)¶

Bit	Function	R/W	Description	Reset
7-0	TEST	R/W	This register is reserved for testing purpose. In normal operation, only 0 should be written into this register. 03h = Digital video decoder & RGB mix direct input test This test mode allows digital data to be input from DTVD[23:0] pins to the input of the digital logic of the video decoder (replaces YCADC output) as the case when the contents of this register is 04h. Besides this, the FPG1/FPB1/FPR1 pins become inputs and provide data in place of RGBADC data output. 04h = Digital video decoder direct input test This test mode allows digital data to be input from DTVD pins to the input of the digital logic of the video decoder. (Replaces ADC output) DTVD(23-16) > "Y" decoder input data, DTVD(15-8) > "U" decoder input data DTVD(7-0) > "V" decoder input data 05h = Closed caption test mode. 06h = YCADC test mode (DTVD pins become outputs) YCADC digital output is made available externally. "Y" ADC output data > DTVD(15-8), "C" & "FB" ADC output data > DTVD(7-0) Index-1F3-bit-7 = 1 > "C" data Index-1F3-bit-7 = 0 > "FB" data. 07h = Digital video decoder output test (DTVD pins become outputs) The output of the digital video decoder output is available externally. "R" decoder out data > DTVD(23-16), "G" decoder out data > DTVD(15-8) "B" decoder out data > DTVD(7-0) "Vsync" > CLAMP "Hsync" > GPIO[1] "Hactive" > GPIO[0] 08h = RGBADC test mode (DTVD pins become outputs) RGBADC digital output is made available externally. "G" ADC output data > DTVD(15-8), "B" & "R" ADC output data > DTVD(7-0) Index-1F3-bit-7 = 1 > "B"data Index-1F3-bit-7 = 0 > "R" data. 09h = DAC test mode. DTVD[7:0] inputs are routed to the DAC data input "DIN". 0Ah = Analog ADC Clamp test mode. DTVD[3:0] inputs are routed to ADC clamping control. 0Bh = DAC test mode. Internal generates incremental data for DAC data input. 11h = TW88 internal node to flat panel output	00h

0x020 – Clamping Gain (CLMPG)

Bit	Function	R/W	Description	Reset
7-4	CLPEND	R/W	These 4 bits set the end time of the clamping pulse in the increment of 8 system clocks. The clamping time is determined by this together with CLPST.	5h
3-0	CLPST	R/W	These 4 bits set the start time of the clamping pulse in the increment of 8 system clocks. It is referenced to PCLAMP position.	0h

0x021 – Individual AGC Gain (IAGC)

Bit	Function	R/W	Description	Reset
7-4	NMGAIN	R/W	These bits control the normal AGC loop maximum correction value.	4h
3-1	WPGAIN	R/W	Peak AGC loop gain control.	1h
0	AGCGAIN8	R/W	This bit is the MSB of the 9-bit register that controls the AGC gain when AGC loop is disabled.	0

0x022 – AGC Gain (AGCGAIN)

Bit	Function	R/W	Description	Reset
7-0	AGCGAIN	R/W	These bits are the lower 8 bits of the 9-bit register that controls the AGC gain when AGC loop is disabled.	F0h

0x023 – White Peak Threshold (PEAKWT)

Bit	Function	R/W	Description	Reset
7-0	PEAKWT	R/W	These bits control the white peak detection threshold.	D8h

0x024– Clamp level (CLMPL)

Bit	Function	R/W	Description	Reset
7	CLMPLD	R/W	0 = Clamping level is set by CLMPL. 1 = Clamping level preset at 60d.	1
6-0	CLMPL	R/W	These bits determine the clamping level of the Y channel.	3Ch

0x025– Sync Amplitude (SYNCT)

Bit	Function	R/W	Description	Reset
7	SYNCTD	R/W	0 = Reference sync amplitude is set by SYNCT. 1 = Reference sync amplitude is preset to 38h.	1
6-0	SYNCT	R/W	These bits determine the standard sync pulse amplitude for AGC reference.	38h

0x026 – Sync Miss Count Register (MISSCNT)

Bit	Function	R/W	Description	Reset
7-4	MISSCNT	R/W	These bits set the threshold for horizontal sync miss count threshold.	4h
3-0	HSWIN	R/W	These bits set the size for the horizontal sync detection window.	4h

0x027 – Clamp Position Register (PCLAMP)

Bit	Function	R/W	Description	Reset
7-0	PCLAMP	R/W	These bits set the clamping position from the PLL sync edge	2Ah

0x028 – Vertical Control I

Bit	Function	R/W	Description	Reset
7-6	VLCKI	R/W	Vertical lock in time. 0 = fastest 3 = slowest.	00
5-4	VLCKO	R/W	Vertical lock out time. 0 = fastest 3 = slowest.	00
3	VMODE	R/W	This bit controls the vertical detection window. 1 = search mode. 0 = vertical count down mode.	0
2	DETV	R/W	1 = recommended for special application only. 0 = Normal Vsync logic	0
1	AFLD	R/W	Auto field generation control 0 = Off 1 = On	0
0	VINT	R/W	Vertical integration time control. 1 = normal 0 = short	0

0x029 – Vertical Control II

Bit	Function	R/W	Description	Reset
7-5	BSHT	R/W	Burst PLL center frequency control.	0h
4-0	VSHT	R/W	Vsync output delay control in the increment of half line length	00h

0x02A – Color Killer Level Control

Bit	Function	R/W	Description	Reset
7-6	CKILMAX	R/W	These bits control the amount of color killer hysteresis. The hysteresis amount is proportional to the value.	1h
5-0	CKILMIN	R/W	These bits control the color killer threshold. Larger value gives lower killer level.	38h

0x02B – Comb Filter Control

Bit	Function	R/W	Description	Reset
7-4	HTL	R/W	Adaptive Comb filter combing strength control.	4h
3-0	VTL	R/W	Adaptive Comb filter combing strength control. Higher value provides stronger comb filtering.	4h

0x02C – Luma Delay and HFilter Control

Bit	Function	R/W	Description	Reset
7	CKLM	R/W	Color Killer mode. 0 = Normal 1 = fast (for special application)	0
6-4	YDLY	R/W	Luma delay fine adjustment. This 2's complement number provides –4 to +3 unit delay control.	3h
3-0	HFLT	R/W	Peaking control 2. The peaking curve is controlled by SCURVE bit.	0h

0x02D – Miscellaneous Control Register I (MISC1)

Bit	Function	R/W	Description	Reset
7	HPLC	R/W	Reserved.	0
6	EVCNT	R/W	1 = Even field counter in special mode. 0 = Normal operation.	0
5	PALC	R/W	Reserved.	0
4	SDET	R/W	ID detection sensitivity. A "1" is recommended.	1
3	TBC_EN	R/W	1 = Internal TBC enabled. (test purpose only) 0 = TBC off.	0
2	BYPASS	R/W	It controls the standard detection and should be set to '1' in normal use.	1
1	SYOUT	R/W	1 = Hsync is disabled when video loss is detected. 0 = Hsync is always generated.	0
0	HADV	R/W	Reserved.	0

0x02E – Miscellaneous Control Register II (MISC2)

Bit	Function	R/W	Description	Reset
7-6	HPM	R/W	Horizontal PLL acquisition time. 0 = slow 1 = medium 2 = auto 3 = Fast	2h
5-4	ACCT	R/W	ACC time constant 00 = No ACC 01 = slow 10 = medium 11 = fast	2h
3-2	SPM	R/W	Burst PLL control. 0 = Slowest 1 = Slow 2 = Fast 3 = Fastest	1h
1-0	CBW	R/W	Chroma low pass filter bandwidth control. 0 = Low 1 = Medium 2 = High 3 = NA	1h

0x02F – Miscellaneous Control III (MISC3)

Bit	Function	R/W	Description	Reset
7	NKILL	R/W	1 = Enable noisy signal color killer function in NTSC mode. 0 = Disabled.	1
6	PKILL	R/W	1 = Enable automatic noisy color killer function in PAL mode. 0 = Disabled.	1
5	SKILL	R/W	1 = Enable automatic noisy color killer function in SECAM mode. 0 = Disabled.	1
4	CBAL	R/W	0 = Normal output 1 = special output mode.	0
3	FCS	R/W	1 = Force decoder output value determined by CCS. 0 = Disabled.	0
2	LCS	R/W	1 = Enable pre-determined output value indicated by CCS when video loss is detected. 0 = Disabled.	0
1	CCS	R/W	When FCS is set high or video loss condition is detected when LCS is set high, one of two colors display can be selected. 1 = Blue color. 0 = Black.	0
0	BST	R/W	1 = Enable blue stretch. 0 = Disabled.	0

0x030 – Macrovision Detection

Bit	Function	R/W	Description	Reset
7 SI	D_FAIL	R		-
6 PI	D_FAIL	R		-
5 F	SC_FAIL	R		-
4 SL	OCK_FAIL	R		-
3	CSBAD	R	1 = Macrovision color stripe detection may be un-reliable	-
2	MCVSN	R	1 = Macrovision AGC pulse detected. 0 = Not detected.	-
1	CSTRIPE	R	1 = Macrovision color stripe protection burst detected. 0 = Not detected.	-
0	CTYPE	R	This bit is valid only when color stripe protection is detected, i.e. CSTRIPE=1. 1 = Type 2 color stripe protection 0 = Type 3 color stripe protection	-

0x031 – Chip STATUS II (CSTATUS2)

Bit	Function	R/W	Description	Reset
7 VC	R	R	VCR signal indicator	-
6	WKAIR	R	Weak signal indicator 2	-
5	WKAIR1	R	Weak signal indicator1	-
4	VSTD	R	Standard line per field indicator	-
3	NINTL	R	Non-interlaced signal indicator	-
2	WSSDET	R	1 = WSS data detected. 0 = Not detected.	-
1	EDSDET	R	1 = EDS data detected. 0 = Not detected.	-
0	CCDET	R	1 = CC data detected. 0 = Not detected.	-

0x032 – H Monitor (HFREF)

Bit	Function	R/W	Description	Reset
7-0	HFREF, etc.	R	Horizontal line frequency indicator HREF[9:2] / GVAL[8:1] / PHERRDO / CGAINO / BAMPO / MINAVG / SYTHRD / SYAMP	-

0x033 – CLAMP MODE(CLMD)

Bit	Function	R/W	Description	Reset
7-6	FRM	R/W	Free run mode. 0X = Auto mode 10 = 60 Hz 11 = 50 Hz	0h
5-4	YNR	R/W	Y HF Noise Reduction. 0 = None 1 = smallest 2 = small 3 = medium	0h
3-2	CLMD	R/W	Clamping mode control. 00 = Sync top 1 = Auto 2 = Pedestal 3 = N/A	1h
1-0	PSP	R/W	Slice level. 0 = Low 1 = Medium 2 = High	1h

0x034 – ID Detection Control (NSEN/SSEN/PSEN/WKTH)

Bit	Function	R/W	Description	Reset
7-6	Index	R/W	These two bits indicate which of the four lower 6-bit registers is currently being controlled. The write sequence is a two steps process unless the same register is written. A write of {ID,000000} selects one of the four registers to be written. A subsequent write will actually write into the register.	00
5-0	NSEN / SSEN / PSEN / WKTH	R/W	IDX = 0 contrds the NTSC ID detection sensitivity (NSEN). IDX = 1 contrds the SECAM ID detection sensitivity (SSEN). IDX = 2 contrds the PAL ID detection sensitivity (PSEN). IDX = 3 contrds the weak signal detection sensitivity (WKTH).	1E / 20 / 1C / 2A

0x035 – Clamp Control (CLCNTL)

Bit	Function	R/W	Description	Reset
7	CTEST	R/W	Clamping control for debug use.	0
6	YCLEN	R/W	1 = Y channel clamp disabled 0 = Enabled.	0
5	CCLEN	R/W	1 = C channel clamp disabled 0 = Enabled.	0
4	VCLEN	R/W	1 = V channel clamp disabled 0 = Enabled.	0
3	GTEST	R/W	1 = Test. 0 = Normal operation.	0
2	VLPF	R/W	Sync filter bandwidth control	0
1	CKLY	R/W	Clamping current control 1.	0
0	CKLC	R/W	Clamping current control 2.	0

Deleted: V

Deleted: V

0x038 – Anti-Aliasing Filter and Decoder Control

Bit	Function	R/W	Description	Reset
7	DEC_SEL	R/W	Analog ADC input selection 0 : Input from RGB path 1 : Input from Decoder path	1
6-4	Reserved	R/W	Reserved	-
3	FBPY	R/W	Anti-Aliasing Filter control channel Y 0 : Filter 1 : Bypass	0
2	FBPV	R/W	Anti-Aliasing Filter control channel V 0 : Filter 1 : Bypass	0
1	FBPC	R/W	Anti-Aliasing Filter control channel C 0 : Filter 1 : Bypass	0
0	MIX (SY+C)	R/W	Analog YOUT control 0 : Y output, 1 : Y + C output	0

Flat Panel Display Registers

0x040 to 0x04F – Scaler Input Control Registers

Address	Bit	R/W	Description	Reset
0x040	7	R/W	This bit has dual function. It serves as odd field detection method selection or ITU656 progressive/interlaced selection. If bits 3:2 of Index 44h does not choose ITU656: Odd Field Detection Method for Digital input port 0: Use internal default method 1: Use Detection method defined by register 0x45 If bits 3:2 selects ITU656, this bit sets the input to interlaced (0) or progressive(1).	0
	6	R/W	Invert internal detected field signal	0
	5	R/W	Field is determined by the leading or trailing edge of input VSYNC when using 0x45 for field determination. 1: Trailing edge.	0
	4	R/W	Enable CSYNC (Composite SYNC); DTVHS is treated as a CSYNC input.	0
	3	R/W	DE polarity of the digital source. 0: Active High	0
	2	R/W	HSYNC polarity of the digital source. 0: Active High	0
	1	R/W	VSYNC polarity of the digital source. 0: Active High	0
	0	R/W	Invert Digital input port DTVCLK polarity, 0: Rising edge 1: Falling edge	0
Address	Bit	R/W	Description	Reset
0x041	7 R/	W	0= COAST signal stays at either 0 or 1. 1= Enable COAST signal output.	0
	6 R/	W	Change COAST polarity in the disabled state and default state. 0: COAST is defaulted to “0” and driven to “0” outside of the window defined by 0x44 1: COAST is defaulted to “1” and driven to “1” outside of the window defined by 0x44	0
	5 R/	W	Select Explicit DE (Data Enable also called HA for Horizontal Active); 0: HA is asserted in the input active region defined by registers 0x47 through 0x4D 1: HA is defined by individual video source	1
	4 R/	W	0 = Pin DTVDE is used as the data enable (DE). 1 = Pin DTVDE is used as HSYNC input	0
	3 R/	W	Reserved.	0
	2 - 0	R/W	Input clock DTVCLK delay time selection. 000: No delay time inserted. Each increment increases the delay by 1 ns.	000

Address	Bit	R/W	Description	Reset
0x042	7	R/W	Enable field detection for Digital input port when index 44 bit 1 & 0 is 2'b01.	0
	6	R/W	Set this bit to "1" if the DTVVS input is not a pulse but a "field" signal.	0
	5 R/	W	ITU656 even field VSYNC delay. 1: Delay the assertion to the falling edge of "ha". 0: No delay	0
	4 R/	W	Use filtered HSYNC to maintain constant input HSYNC period.	0
	3	R/W	Set this bit to 1 in 8 bit 601 mode if the Cr data arrives before Cb data.	0
	2 –0	R/W	Data bus routing selection for Digital input port For 24 bit YpbPr or 24 bit RGB D TVD[23:16] DTVD[15:8] DTVD[7:0] 000: Pr/B Y/R Pb/G 001: Pr/B Pb/G Y/R 010: Pb/G Y/R Pr/B 011: Pb/G Pr/B Y/R 100: Y/R Pb/G Pr/B 101: Y/R Pr/B Pb/G For 16 bit Ypb/Pr: Follow the table above with Y and Pb. Example: If Y data is connected to DTVD[23:16] and Pb/Pr data is connected DTVD[7:0], the bus routing selection should be set to "101". If Explicit DE, Index 44 bit [4], is set, the very first DTVDE is assumed to have Pb data. On the other hand if Explicit DE is reset, Index 40 bit [3] is used to select the order of Pb /Pr. For 8 bit Y/Pb/Pr: Follow the table above with Pr. Example: If Y/Pb/Pr data is connected to DTVD[15:8], the bus routing selection can be set to "011" or "101". Use the table below for the correct data order. Index 41 bit 5 Index 40 bit 3 Index 42 bit 3 Data Order 1 X 0 Pb-Y-Pr-Y 1 X 1 Pr-Y-Pb-Y 0 0 0 Pb-Y-Pr-Y 0 0 1 Pr-Y-Pb-Y 0 1 0 Y-Pb-Y-Pr 0 1 1 Y-Pr-Y-Pb	100
Address	Bit	R/W	Description	Reset
0x043	7	R/W	When this bit is set to one, IRQ output is used to output the PLLCK.	0
	6	R/W	Reserved.	0
	5-4	R/W	FPCLK output driving capability control. 00 = reserved 01 = 4mA 10=8mA 11= disabled	10h
	3	R/W	When this bit is set to one, GPIO[2] output is used to output the PLLCK. For PLL operation monitoring.	0
	2	R/W	Reserved.	-
	1-0	R/W	DEC_VS, DEC_HS polarity control 00 = VS active hign, HS active low 01 = VS active high, HS active high 10 = VS active low, HS active low 11 = VS active low, HS active high	10h

Address	Bit	R/W	Description	Reset
0x044	7 - 6	R/W	Pin COAST is driven to "enabled" state in the window defined below 00: COAST enabled 1 HSYNC period before VSYNC and 7 HSYNC periods after VSYNC 01: COAST enabled 2 HSYNC periods before VSYNC and 8 HSYNC periods after VSYNC 10: COAST enabled 3 HSYNC periods before VSYNC and 9 HSYNC periods after VSYNC 11: COAST enabled 4 HSYNC periods before VSYNC and10 HSYNC periods after VSYNC	00
	5	R/W	Reserved	0
	4 R/	W	1: 8 bit 601 input mode 0: 8bit 656 input mode	0
	3 - 2	R/W	Input format selection; 00: 422 (16 bit ITU601), 01: ITU656 (8 bits) or ITU601 (8 bit) ; determined by bit 4. 10: 444, 11: RGB	10
	1 - 0	R/W	Input Video/DTV Source Selection; 00: Internal analog video decoder, 01/10: DTV input port, 11: Line Lock ADC input port.	00
Address	Bit	R/W	Description	Reset
0x045	7 - 4	R/W	Horizontal Ending Locations of internal Odd Field Detection for Digital input port	0101

Deleted: 01=444, ¶

Address	Bit	R/W	Description	Reset
0x046	7 - 0	R/W	Offset amount to re-construct VSYNC from CSYNC input. The L to H transition of CSYNC input provides the L to H transition of HSYNC. This register defines the amount of offset from this transition edge for generating VSYNC.	0010 0000
Address	Bit	R/W	Description	Reset
0x047	7 - 0	R/W	Input Active Window definition: Horizontal Starting Pixel Position - Low Byte.	0000 0000
Address	Bit	R/W	Description	Reset
0x048	7 - 0	R/W	Input Active Window definition: Horizontal Ending Pixel Position - Low Byte	1100 1111
Address	Bit	R/W	Description	Reset
0x049	7 - 4	R/W	Input Active Window definition: Horizontal Ending Pixel Position – High (Total 12 bits). This position is referenced to the rising edge of input HSYNC.	0010
	3	R/W	Reserved.	-
	2 - 0	R/W	Input Active Window definition: Horizontal Starting Pixel Position - High (Total 11 bits) This position is referenced to the rising edge of input HSYNC.	000
*Note: The value written in this register does not come into effect until a register write to index 0x047 or 0x048 is followed.				
Address	Bit	R/W	Description	Reset
0x04A	7-0	R/W	Input Active Window definition: Odd Field Vertical Line Start Position - Low Byte	0001 0011
Address	Bit	R/W	Description	Reset
0x04B	7-0	R/W	Input Active Window definition: Even Field Vertical Line Start Position - Low Byte	0001 0011
Address	Bit	R/W	Description	Reset
0x04C	7-0	R/W	Input Active Window definition: Vertical Length - Low Byte	0000 0000
Address	Bit	R/W	Description	Reset
0x04D	7	R/W	Reserved.	0
	6 - 4	R/W	Input Active Window definition: Vertical Length - High (Total 11 bits)* The unit of this length is one input HSYNC.	011
	3 - 2	R/W	Input Active Window definition: Even Field Vertical Line Start Position - High (Total 10 bits)*. This position is referenced to the rising edge of input VSYNC.	00
	1 - 0	R/W	Input Active Window definition: Odd Field Vertical Line Start Position - High (Total 10 bits)*. This position is referenced to the rising edge of VSYNC.	00
*Note: When the Explicit-DE is not used (Register 0x041, bit 5), the input active window is defined by the above H-Active and V-Active registers.

0x05B	7 - 4	R/W	Select which measurement result to read out from 0x57 ~ 0x5A 0000: Phase Measurement Result - Blue (use Result 3-0 registers) 0001: Phase Measurement Result - Green (use Result 3-0 registers) 0010: Phase Measurement Result - Red (use Result 3-0 registers) 0011: Minimum Value (Result2: R, Result1: G, Result 0:B) 0100: Maximum Value (Result2: R, Result1: G, Result 0:B) 0101: VSYNC Period (Result3, 2) HSYNC Period (Result 1, 0) 0110: HSYNC Rise to HSYNC Fall Interval (Result 1, 0) and HSYNC Rise to HACTIVE Fall Interval (Result 3, 2). 0111: VSYNC pulse width (Result 1,0), Horizontal pixel counter value at the leading edge of VSYNC (Result 3, 2). 1000: Min Horizontal Active Starting Pixel (Results 1 & 0) Max Horizontal Active Starting Pixel (Results 3 & 2) 1001: Min Horizontal Active Ending Pixel (Results 1 & 0) Max Horizontal Active Ending Pixel (Results 3 & 2) 1010: Vertical Active Starting Line recorded with a. Min Vertical Active Starting Line (Results 1 & 0) b. Max Vertical Active Starting Line (Results 3 & 2) 1011: Vertical Active Ending Line recorded with a. Min Vertical Active Ending Line (Results 1 & 0) b. Max Vertical Active Ending Line (Results 3 & 2) 1100: Horizontal counter value when buffer read pointer starts to toggle. (Results 1 & 0) 1101: Luminance values. Minimum luminance (Result 0) Maximum luminance (Result 1) Average luminance (Result2) 1110: VSYNC Period measured with 27 MHz clock (Result 2, 1 & 0).	0000
	3 - 2	R/W	Field Selection for Input Measurement 00: Odd field only 01: Even field only 1x: Disregard field	00
	1 R/	W	Reserved.	0
	0 R/	W	Start Input Measurement. This bit is self-cleared after the measurement is done.	0
Address	Bit	R/W	Description	Reset
0x05C	7 R/	W	0: Use FPCLK for input HSYNC period measurement. 1: Use 27MHz clock for input HSYNC period measurement.	0
	6 - 4	R/W	Noise mask bits for each of the 3 LSB input signals.	000
	3 - 1	R/W	Error Tolerance before asserting "Change Detected" status 000: Exact match 001: Up to 4 counts 0 10: Up to 8 counts 011: Up to 16 counts 100: Up to 32 counts 101: Up to 64 counts 110: Up to 128 counts 111: Up to 256 counts.	000
	0 R/	W	Enable Input VSYNC, HSYNC Period Change/Loss Detection. When this bit is set, the internal circuitry will perform new measurements. The new results are compared against the results retained in the registers obtained by the most recent measurement.	0
Address	Bit	R/W	Description	Reset
0x05D	7 - 4	R/W	Threshold value for input active region detection. Each increment increases the threshold value by 16.	0011
	3 R/	W	1:Enable luminance measurement.	0
	2 - 1	R/W	Noise filter selection for luminance measurement.	00
	0 R/	W	Reserved.	0

0x060 to 0x06B – Zoom Control Registers

Address	Bit	R/W	Description	Reset
0x060	7 - 0	R/W	Horizontal (X-Direction) Scale Up Factor – Higher Fraction Byte (Coarse adjustment) 65536 * (Input Horizontal Active Pixel Number) / (Flat Panel Horizontal Active Pixel Number) Example: VGA 640x480 , Panel Resolution: 1024x768 65536 * 640 / 1024 = 40960 = 0A000h Example: Decoder 720x240, Panel Resolution: 1024x768 65536 * 720 / 1024 = 46080 = 0B400h	1011 0100
Address	Bit	R/W	Description	Reset
0x061	7 - 0	R/W	Horizontal (X-Direction) Scale Down Factor - Fraction Byte 128 * (Input Horizontal Active Pixel Number) / (Flat Panel Horizontal Active Pixel Number) Example: Decoder 720x240, Panel Resolution: 640x480 128 * 720 / 640 = 144 = 090h	1000 0000
Address	Bit	R/W	Description	Reset
0x062	7 - 0	R/W	Vertical (Y-Direction) Scale Up Factor – Higher Fraction Byte (Coarse adjustment) 65536 * (Input Vertical Active Pixel Number) / (Flat Panel Vertical Active Pixel Number) Example: VGA 640x480 , Panel Resolution: 1024x768 65536 * 480 / 768 = 40960 = 0A000h Example: Decoder 720x240, Panel Resolution: 1024x768 65536 * 240 / 768 = 20480 = 05000h	0101 0000
Address	Bit	R/W	Description	Reset
0x063	7	R/W	1: Enable Panorama / Water-glass scaling.	0
	6 - 5	R/W	Reserved.	00
	4 R/	W	Set Zoom by-pass. When this bit is set, the Horizontal and Vertical scale up factors has no effects.	0
	3 - 2	R/W	Integer portion of Vertical (Y-Direction) Scale factor (Total 18 bits). For vertical scale up, maximum value is 0x10000. For vertical Y-direction scale down, the value should be larger than 0x100. Vertical Scale Factor < 0x10000 : Up scaling Vertical Scale Factor = 0x10000 : No scaling Vertical Scale Factor > 0x10000 : Down scaling The max vertical down scaling factor that the scaler can handle is 0x20000.	00
	1	R/W	Horizontal (X-Direction) Scale Down Factor – Integer portion bit (Total of 9 bits)	0
	0	R/W	Horizontal (X-Direction) Scale Up Factor – Integer portion bit (Total 17 bits)	0
Address	Bit	R/W	Description	Reset
0x064	7 - 0	R/W	Horizontal (X-Direction) Scale Up Offset This offset is used to adjust the initial value for the X-Direction scale up operation.	0000 0000
Address	Bit	R/W	Description	Reset
0x065	7 - 0	R/W	Vertical (Y-Direction) Scale Up Offset for Odd field This offset is used to adjust the initial value for the Y-Direction scale up operation.	1000 0000
Address	Bit	R/W	Description	Reset
0x066	7 - 0	R/W	Horizontal non-display pixel number applied to both left and right sides. This is useful when displaying 4:3 image on wide screen 16:9 panel. Example: A wide screen panel with 1024 horizontal pixels. If this register has a value of 100, the active horizontal display will be 824 pixels. Each side is "blacked" out by 100 pixels. This register also serves as the panorama horizontal width definition.	0000 0000
Address	Bit	R/W	Description	Reset
0x067	7 R/	W	1: Non-display left/right independent control.. Use 0x66,67[1:0] only for left and use 0x6C,67[5:4] for right, 0:Use 0x66,67[1:0] for both left and right.	0
	5 - 4	R/W	Thnd2[9:8] Non display width for right side (MSB)	00
	3 - 2	R/W	Reserved	-
	1 - 0	R/W	High 2 bits of 0x066 register.	00

Address	Bit	R/W	Description	Reset
0x068	7 - 0	R/W	Horizontal scale at the side of display in panorama scaling mode.	0000 0000
Address	Bit	R/W	Description	Reset
0x069	7 - 0	R/W	Horizontal (X-Direction) Scale Up Factor – Lower Fraction Byte (Fine adjustment)	0000 0000
Address	Bit	R/W	Description	Reset
0x06A	7 - 0	R/W	Vertical (Y-Direction) Scale Up Factor – Lower Fraction Byte (Fine adjustment)	0000 0000
Address	Bit	R/W	Description	Reset
0x06B	7 - 0	R/W	Vertical (Y-Direction) Scale Up Offset for Even field	0000 0000
Address	Bit	R/W	Description	Reset
0x06C	7 - 0	R/W	Thnd2[7:0] Non display width for right side (LSB)	0000 0000
Address	Bit	R/W	Description	Reset
0x06D	7 - 6	R/W	Reserved	-
	5 - 0	R/W	Top (or both Top and Bottom) line number to be masked	00 0000
Address	Bit	R/W	Description	Reset
0x06E	7 R/	W	1: Top/Bottom masking independent control enable. (0x6E[5:0] is active and 0x6D only controls top), 0: 0x6D controls both top and bottom [Default]	0
	6 R/	W	Reserved	-
	5 - 0	R/W	Bottom line number to be masked.	00 0000

0x070 to 0x07B – Image Adjustment Registers

Address	Bit	R/W	Description	Reset
0x070	7 R/	W	Reserved.	0
	6 R/	W	There are 2 sets of registers for index 71 ~ 76. 0: Select the 1st set, R/G/B Contrast and R Brightness 1: Select the 2nd set, Y/Cb/Cr Contrast and Y Brightness	0
	5 - 0	R/W	Hue Adjustment for Digital Input Port. These bits control the color hue. The range is +45 degrees to –45 degrees in 1.4 degree increments. 0 degrees is the default (xx10 0000)	10 0000
Address	Bit	R/W	Description	Reset
0x071	7 - 0	R/W	Red (or Y) Contrast Adjustment for all input sources 80h+ : Higher contrast, 80h: Neutral, 80h-: Lower contrast	1000 0000
Address	Bit	R/W	Description	Reset
0x072	7 - 0	R/W	Green (or Cb) Contrast Adjustment for all input sources 80h+ : Higher contrast, 80h: Neutral, 80h-: Lower contrast	1000 0000
Address	Bit	R/W	Description	Reset
0x073	7 - 0	R/W	Blue (or Cr) Contrast Adjustment for all input sources 80h+ : Higher contrast, 80h: Neutral, 80h-: Lower contrast	1000 0000
Address	Bit	R/W	Description	Reset
0x074	7 - 0	R/W	Red (or Y) Brightness Adjustment for all input sources 80h+ : Higher brightness, 80h: Neutral, 80h-: Lower brightness	1000 0000
Address	Bit	R/W	Description	Reset
0x075	7 - 0	R/W	Green Brightness Adjustment for all input sources 80h+ : Higher brightness, 80h: Neutral, 80h-: Lower brightness	1000 0000
Address	Bit	R/W	Description	Reset
0x076	7 - 0	R/W	Blue Brightness Adjustment for all input sources 80h+ : Higher brightness, 80h: Neutral, 80h-: Lower brightness	1000 0000
Address	Bit	R/W	Description	Reset
0x077	7 - 4	R/W	Coring function for peaking control.	0011
	3 - 0	R/W	Peaking adjustment	1111
Address	Bit	R/W	Description	Reset
0x078	7 R/	W	Sharpness frequency select. 0 = Low freq. 1 = High freq.	0
	6 R/	W	Reserved.	-
	5 - 4	R/W	YNR.	00
	3 - 0	R/W	Sharpness adjustment.	1010
Address	Bit	R/W	Description	Reset
0x079	7 - 4	R/W	Reserved.	-
	3 R/	W	Reserved.	-
	2 - 0	R/W	Reserved.	-
Address	Bit	R/W	Description	Reset
0x07A	7 - 0	R/W	Reserved.	-
Address	Bit	R/W	Description	Reset
0x07B	7 - 4	R/W	Reserved.	-
	3 - 0	R/W	Reserved	0100

0x07C to 0x08B – Black/White Stretch Adjustment Registers

Address	Bit	R/W	Description	Reset
0x07C	7	R/W	1: BW stretch test.	0
	6	R/W	1: Use histogram information.	0
	5	R/W	Black level selection. 0: 0 1: 16	0
	4	R/W	White level selection. 0: 235 1: 255	1
	3	R/W	Black stretch limit. 1: Stretch regardless of black level, 0: Limit stretch up to black level	1
	2	R/W	White stretch limit. 1: Stretch regardless of white level, 0: Limit stretch up to white level	1
	1	R/W	1: Bypass BW stretch and peaking 0: Normal	0

	4 R/	W	FP data outputs shift down 2 bits. When set, FPR0, FPR1, FPG0, FPG1, FPB0, FPB1 bus signals are shifted down by 2 bits.	0
	3 R/	W	Tri-state all the output signals to flat panel.	0
	2 - 0	R/W	Panel clock FPCLK delay time selection. 000: No delay time inserted. Each increment increases the delay by 1 ns.	000
Address	Bit	R/W	Description	Reset
0x0B2	7 - 0	R/W	FPHS Period - Low Byte	0011 1010
Address	Bit	R/W	Description	Reset
0x0B3	7 - 0	R/W	FPHS Active Pulse Width This register is usually filled in with the minimum FPHS pulse width requirement from the flat panel specification	0001 0000
Address	Bit	R/W	Description	Reset
0x0B4	7 - 0	R/W	Flat Panel Horizontal Back Porch Width --- The duration from the trailing edge of FPHS to the leading edge of FPDE. This register is usually filled in with the minimum horizontal back porch requirement from the flat panel specification.	0001 1011
Address	Bit	R/W	Description	Reset
0x0B5	7 - 0	R/W	FPDE Horizontal Active Length	0000 0000

Address	Bit	R/W	Description	Reset
0x0B6	7 R/	W	When this bit is set, the internal circuitry uses the programmed value of index B6[3:0] and index B2[7:0] as the FPHS period disregarding the setting of "Auto Calculation", bit 1 of index BE.	0
	6 - 4	R/W	FPDE Horizontal Active Length – High three bits (Total 11 bits) This horizontal active length is equivalent to the panel horizontal resolution. For example, the horizontal resolution of an XGA panel is 1024.	100
	3 - 0	R/W	FPHS Period – High three bits (Total 12 bits) The following formula gives the correct number to fill in for FPHS period. FPHS_Period = *F*_pllcki / (*F*_ihsync * VSUR) Where *F*_pllcki is the frequency of EXTCLK, *F*_ihsync is the frequency of input HSYNC, and VSUR is the vertical scale up ratio. VSUR = (Panel Vertical Resolution) / (Input Vertical Resolution) Example: Input is VGA with HSYNC frequency 31.5KHz with 60 Hz refresh rate to be displayed on an XGA panel. VSUR = 768/480 = 1.6 Choose *F*_pllcki = 69 MHz FPHS_Period = 69000000 / (31500 * 1.6) = 1369.05 → 1369 = 559h	0010
Note: The unit for Index B2 through B6 is one panel pixel clock, which is either the output of internal PLL or EXTCLK. The FPHS Period should be larger than the sum of 1) FPHS Active Pulse Width, 2) FPHS Back Porch Width, and 3) FPDE Horizontal Active Length.				
Address	Bit	R/W	Description	Reset
0x0B7	7 - 0	R/W	FPVS Period - Low Byte	0010 0110
Address	Bit	R/W	Description	Reset
0x0B8	7 - 0	R/W	FPVS Active Pulse Width The unit of this pulse width is one FPHS. This register is usually filled in with the minimum FPVS pulse width requirement from the flat panel specification.	0000 0110
Address	Bit	R/W	Description	Reset
0x0B9	7 - 0	R/W	Flat Panel Vertical Back Porch Width The unit of this pulse width is one FPHS. The following formula gives the correct number to fill in for FPVS back porch. FPVS_Back_Porch = (VAS–VSYNC_pw+2)* VSUR–FPVS_Pulse_Width Where VAS is the input Vertical active starting line number, VSYNC_pw is the input VSYNC pulse width, VSUR is the Vertical Scale Up ratio. VSUR = (Panel Vertical Resolution) / (Input Vertical Resolution)	0001 1111
Address	Bit	R/W	Description	Reset
0x0BA	7 - 0	R/W	Flat Panel Vertical Active Length - Low Byte	0000 0000
Address	Bit	R/W	Description	Reset
0x0BB	7	R/W	Early start. Start to output data earlier in non auto calculation mode.	0
	6 - 4	R/W	Flat Panel Vertical Active Length - High three bits (Total 11 bits) The unit of this active length is one FPHS This vertical active length is equivalent to the panel vertical resolution. For example, the vertical resolution of an XGA panel is 768.	011
	3	R/W	This bit is for internal used.	0
	2 - 0	R/W	FPVS Period – High three bits (Total 11 bits) The unit of this period is one FPHS.	011
Note: The unit for Index B7 through BB is one FPHS, i.e. whenever there is an active FPHS, the count is incremented by 1. The FPVS Period should be larger than the sum of 1) FPVS Active Pulse Width, 2) FPVS Back Porch Width, and 3) Flat Panel Vertical Active Length.				
Note: The value written in this register does not come into effect until it is followed by a register write to index 0x0B7 or 0x0BA.				

Address	Bit	R/W	Description	Reset

Address	Bit	R/W	Description	Reset
0x0BD	7 - 0	R/W	Output Vsync delay from Input Vsync	0000 1000
Address	Bit	R/W	Description	Reset
0x0BE	7	R/W	Force long. In auto calculation with this bit set, the FPHS period assumes the next higher integer value if the calculated FPHS contains fractional part.	0
	6	R/W	Force short. In auto calculation with is bit set, the FPHS period assumes the integer part; i.e. the fractional part of the calculated FPHS period is discarded.	0
	5	R/W	Tri-State PWM pin.	0
	4	R/W	PWM polarity. 1: Active low	0
	3	R/W	When set, the input “HACTIVE” or “DE” is forced to inactive if either VSYNC or HSYNC is active.	0
	2	R/W	Force into free run mode.	0
	1	R/W	Enable auto calculation. When this bit is set, an internal circuitry calculates the optimum FPHS period, and then adjusts the FPHS period dynamically so that for one vsync (FPVS) period it has integer multiples of FPHS. The internal circuitry also adjust the FPHS active position to minimize the line buffer overflow/underflow.	0
	0	R/W	When this bit is set, the input VSYNC is delayed by the amount specified by index 0xBD in the unit of input HSYNC. The regular meaning of index 0xBD -- “Output VSYNC delay from Input VSYNC” is fixed at 2.	0

Address	Bit	R/W	Description	Reset

0x0D0	7	R	Line buffer over flow	This bit is set if the FP clock count exceeds the maximum number in between two consecutive FPHS pulses for the even field, cleared by writing back a "1".	-
	6	R	Line buffer under flow	This bit is set if the FP clock count exceeds the maximum number in between two consecutive FPHS pulses for the odd field, cleared by writing back a "1".	-
	5	R	Input VSYNC Loss status changed	This bit is set when the status bit of "Input VSYNC Loss" had changed, either 1 to 0 or 0 to 1. This bit is cleared by writing back a "1", or by resetting the "endet" bit.	-
	4	R	Input HSYNC Loss status changed	This bit is set when the status bit of "Input HSYNC Loss" had changed, either 1 to 0 or 0 to 1. This bit is cleared by writing back a "1", or by resetting the "endet" bit.	-
	3	R/W	Video input status changed indication	Vdloss status bit change (register 1 bit 7) or det50 status bit change (register 1 bit 0) Write a one to this bit to reset.	0
	2	R	Input VSYNC Loss	This bit is set when the input VSYNC pulse is lost, reset by re-appearance of VSYNC. An 11-bit counter is used for VSYNC period measurement. If this counter overflows 4 times, the VSYNC is considered to be lost.	-
	1 R		Input HSYNC Loss	This bit is set when the input HSYNC pulse is lost, reset by re-appearance of HSYNC. An 11-bit counter is used for HSYNC period measurement. If this counter overflows 4 times, the HSYNC is considered to be lost.	-
	0 R		SYNC detect status	Logic function of: Inverted "bit 1" ANDing with inverted "bit 2"	-
Address	Bit	R/W	Name	Description	Reset
0x0D1	7 R		Input Measurement Data Ready	This bit is set when the measurement data is ready for readout, reset when a new "startm" is set.	-
	6 R		Power State Changed	This bit is set when the power management state has changed, reset by writing back a "1".	-
	5	R	Input VSYNC Period Change Detected	This bit is set when the input VSYNC period is changed, reset when "endet" is cleared. When "endet" bit is set, the VSYNC period is measured for every frame. If the difference from the last measurement result stored in the registers, is larger than the error tolerance, the VSYNC period is considered to have changed.	-

Deleted: FPHS max clock violation in even field

Deleted: FPHS max clock violation in odd field

Deleted: Reserved

Address	Bit	R/W	Name	Description	Reset
	4 R		Input HSYNC Period Change Detected	This bit is set when the input HSYNC period is changed, reset when "endet" is cleared. When "endet" bit is set, the HSYNC period is measured for every scan line. If the difference from the last measurement result stored in the registers, is larger than the error tolerance, the HSYNC period is considered to have changed.	-
	3	R	Line buffer Overflow or Underflow		-
	2	R	VDCCDET	High if there is a change in VDLOSS or DET50 or CCVALID	-
	1 R		VLOSS/ HLOSS status changed	This bit reflects the “OR” condition of status bit index B0 bit 5 (VLOSS status changed) and index B0 bit 4 (HLOSS status changed).	-
	0 R		"SYNC Detect Status" Changed	This bit is set when the status bit of "SYNC Detect Status" had changed, either 1 to 0 or 0 to 1. This bit is cleared by writing back a "1", or by resetting the "endet" bit.	-

Deleted: Interrupt request status

0x0D4 to 0x0D8 – Power Management Registers

Address	Bit	R/W	Description	Reset
0x0D4	7-0	R/W	MSB of an internal 23 bit divide down counter. The 27 MHz clock from XTAL27I is divided by this counter to serve as the clock for the Power State Transition timer.	0000 0000
Address	Bit	R/W	Description	Reset
0x0D5	7	R/W	Force the internal PCLK to "0".	0
	6	R/W	Power sequence reference source selection. 0 : 27MHz 1 : VSYNC	0
	5-4	R	Show current power management state. These power states determine the states of pins FPPWC, FPBIAS & FP interface signals which includes FPVS, FPHS, FPDE, FPCLK and all data signals. FPPWC FPBIAS FP Interface Signals 00: Off "0" "0" "0" 01: Standby "1" "0" "0" 10: Suspend "1" "0" "1" or "0" 11: On "1" "1" "1" or "0" The transition between the power states does not occur right away. It takes place after the timer expiration by the corresponding timer counts defined in 0xD6-0xD8.	00
	3	R/W	Manual power sequencing control. When this bit is set, bits [2:0] control FPBIAS, FP Interface Signals, and FPPWC directly.	0
	2	R/W	If bit 3 is "0" and this bit is "1", this enable auto power sequencing. VSYNC loss & HSYNC loss ---> Off VSYNC loss & HSYNC active ---> Standby VSYNC active & HSYNC loss ---> Suspend VSYNC active & HSYNC active ---> On	0
	1-0	R/W	Power state steering. When these 2 bits are written, assuming both bit 3 and bit 2 are 0's, and the current power state is different from the value written, the power state will be sequencing to the state that matches the value written. For example, current power state is 11. A 01 value is written. The power state will be steered to "01" and stay in "01. 00: Off State, 01: Standby, 10: Suspend, 11: ON state	00
Address	Bit	R/W	Description	Reset
0x0D6	7-4	R/W	Timer Counts for Suspend State to Standby State Transition	0000
	3-0	R/W	Timer Counts for On State to Suspend State Transition	0000
Address	Bit	R/W	Description	Reset
0x0D7	7-4	R/W	Timer Counts for Power Off State to Standby State Transition	0000
	3-0	R/W	Timer Counts for Standby State to Power Off State Transition	0000
Address	Bit	R/W	Description	Reset
0x0D8	7-4	R/W	Timer Counts for Standby State to Suspend Sate Transition	0000
	3-0	R/W	Timer Counts for Suspend to On State Transition	0000

0x0DA to 0x0DF – Color Enhancement

1-0	LFT_RHT R	/W	Left/Right display direction select 2'b00 : Left low active (Normal) 2'b01 : Left high active (Normal) 2'b10 : Right low active (Mirror) 2'b11 : Right high active (Mirror)	TCLRL TCSPL TCSPR	01

0x183 – Control Signal Polarity Selection Register

Bit	Function	R/W	Description	Relative Pin	Reset
7-5	Reserved	R/W	Reserved		-
4	RCK_P	R/W	Row Clock Polarity Control signal	TRCLK 1	
3	ROE_P	R/W	Row Driver Output Enable signal 0 : Active low 1 : Active high	TROE 1	
2	RSP_P	R/W	Row Driver Start Pulse signal 0 : Active low 1 : Active high	TRSPT TRSPB	1
1	CLP_P	R/W	Column Driver Latch Pulse signal 0 : Active low 1 : Active high	TCLP 1	
0	CSP_P	R/W	Column Driver Start Pulse signal 0 : Active low 1 : Active high	TCSPL TCSPR	1

0x184 – Control Signal Generation Method Register

Bit	Function	R/W	Description	Relative Pin	Reset
7-6	Reserved	R/W	Reserved		-
5	PGM_RCK	R/W	Row Driver Clock signal 0 : This is generate during horizontal display enable. 1 : It's generated that set TCON register address 1A0 though 1A3.	TRCLK 0	
4	PGM_ROE	R/W	Row Driver Output Enable signal 0 : This is generate during horizontal display enable. 1 : It's generated that set TCON register address 1AC though 1AF. Also, this is relative to vertical active register 18C though 18F.	TROE 0	
3	PGM_RSP	R/W	Row Driver Start Pulse signal 0 : This signal immediately generate and then keep one horizontal period activation received from vertical active signal. 1 : It's generated that set TCON register address 1A4 though 1A7. Also, this is relative to vertical back porch register B9.	TRSPT TRSPB	0
2	PGM_CP	R/W	Column Driver Polarity signal 0 : This signal toggling when horizontal display enable started. 1 : It's generated that set TCON register address 190 though 191.	TCPOL 0	
1	PGM_CLP	R/W	Column Driver Latch Pulse signal 0 : This signal generate after horizontal display enable done a every scan line. 1 : It's generated that set TCON register address 192 though 195.	TCLP 0	
0	PGM_CSP	R/W	Column Driver Start Pulse signal 0 : This signal generate after horizontal display enable. 1 : It's generated that set TCON register address 19A though 19D. Also, this is relative to horizontal back porch register B4.	TCSPL TCSPR	0

0x185 – Inversion signal operating period register

Bit	Function	R/W	Description	Relative Pin	Reset
7-1	Reserved	R/W	Reserved		-
0	INV_SW	R/W	Inversion signal (Column Driver) working period selection 0 : Inversion signal working within display enable period 1 : Inversion signal working whole(display enable and blanking time) period	TCPOL 0	

0x18A – Special Companies LCD Module Control Register

Bit	Function	R/W	Description	Relative Pin	Reset
7-6	Reserved	R/W	Reserved		-
5-4	RSP_WIDTH	R/W	Row Driver Start Pulse width (period) selection 0 : One horizontal period 1 : Two horizontal period 2 : Three horizontal period 3 : Four horizontal period	TRSPT TRSPB	00
3-2	Reserved	R/W	Reserved		-
1-0	COMPANY	R/W	LCD module company selection 2'b00 : LG-Philips LCD module 2'b01 : Sharp LCD module 2'b10, 2'b11 : Other companies LCD module	TCPOLP TCPOLN	10

0x18B – REVV(TCPOLP) / REVC(TCPOLN) Control Registers

Bit	Function	R/W	Description	Relative Pin	Reset
7-0	REVV_REVC	R/W	REVV_REVC[7 :0]; for use with Sharp panel	TCPOLP TCPOLN	4D

0x18C – Vertical Active Start High Register

Bit	Function	R/W	Description	Reset
7-4	Reserved	R/W	Reserved	-
3-0	V_ST[11:8]	R/W	VER_ASH[11:8]	0

0x18D – Vertical Active Start Low Register

Bit	Function	R/W	Description	Reset
7-0	V_ST[7:0]	R/W	VER_ASL[7:0]	06

0x18E – Vertical Active End High Register

Bit	Function	R/W	Description	Reset
7-4	Reserved	R/W	Reserved	-
3-0	V_ED[11:8]	R/W	VER_AEH[11:8]	1

0x18F – Vertical Active End Low Register

Bit	Function	R/W	Description	Reset
7-0	V_ED[7:0]	R/W	VER_AEL[7:0]	E2

Column Driver Chip Control Signals Relative Registers

0x190 – Polarity Control High Register

Bit	Function	R/W	Description	Relative Pin	Reset
7-4	Reserved	R/W	Reserved		-
3-0	CP_SW[11:8]	R/W	Programmable polarity period high[11:8] value.	TCPOLP TCPOLN	2

0x191 – Polarity Control Low Register

Bit	Function	R/W	Description	Relative Pin	Reset
7-0	CP_SW[7:0]	R/W	Programmable polarity period low[7:0] value.	TCPOLP TCPOLN	D0

0x192 – Load/Latch Pulse Start High Register

Bit	Function	R/W	Description	Relative Pin	Reset
7-4	Reserved	R/W	Reserved		-
3-0	CLP_ST[11:8]	R/W	LP_HSH[11:8]	TCLP	2

0x193 – Load/Latch Pulse Start Low Register

Bit	Function	R/W	Description	Relative Pin	Reset
7-0	CLP_ST[7:0]	R/W	LP_HSL[7 :0]	TCLP	D0

0x194 – Load/Latch Pulse Width High Register

Bit	Function	R/W	Description	Relative Pin	Reset
7-4	Reserved	R/W	Reserved		-
3-0	CLP_ED[11:8]	R/W	LP_HEH[11:8]	TCLP	0

Bit	Function	R/W	Description	Relative Pin	Reset
7-0	RSP_ED[7:0]	R/W RS	P_VEL[7 :0]	TRSPT TRSPB	01

0x1AC – Row Output Enable High Register

Bit	Function	R/W	Description	Relative Pin	Reset
7-4	Reserved	R/W	Reserved		-
3-0	ROE_ST[11:8]	R/W	ROE_HSH[11:8]	TROE	0

0x1AD – Row Output Enable Low Register

Bit	Function	R/W	Description	Relative Pin	Reset
7-0	ROE_ST[7:0]	R/W	ROE_HSL[7 :0]	TROE	0A

0x1AE – Row Output Enable Width High Register

Bit	Function	R/W	Description	Relative Pin	Reset
7-4	Reserved	R/W	Reserved		-
3-0	ROE_ED[11:8]	R/W	ROE_HEH[11 :8]	TROE	0

0x1AF – Row Output Enable Width Low Register

Bit	Function	R/W	Description	Relative Pin	Reset
7-0	ROE_ED[7:0]	R/W	ROE_HEL[7 :0]	TROE 36	

0x1B0 – Panel type Select Register

Bit	Function	R/W	Description	Relative Pin	Reset
7-2	Reserved	R/W	Reserved		-
1	REV_INV	R/W	Signal output selection 0 : TCINV signal output select 1 : TCREV output select	TCINV TCREV	1
0	LINE_INV	R/W	Analog panel data swapping 0 : No data inversion 1 : Every line data inversion	ROUT GOUT BOUT TCPOLP TCPOLN	0

Analog Sense Block Register

0x1B1 – Analog Sense Block Clock generation register

Bit	Function	R/W	Description	Reset
7-5	Reserved	R/W	Reserved	-
4	BIAS_CTL	R/W	Bias Control	0
3-0	Reserved	R/W	Reserved	-

MCU SFR Register

0x9A – MCU Bank Select Register

Bit	Function	R/W	Description	Reset
7-6	Reserved	R/W	Reserved	-
5-0	BANK_SEL[5:0]	R/W	Bank select for MCU External RAM	0

0x9B – MCU Misc. Control Register

Bit	Function	R/W	Description	Reset
7-6	Reserved	R/W	Reserved	00
5-4	SCLK_SEL[1:0]	R/W	SPI Interface Clock selection. 2'b00 DIV1, 2'b01 DIV2, 2'b10 DIV3, 2'b11 DIV4.	00
3 LO	WSPD	R/W	SPI Interface Speed Control bit. 1'b1 low speed mode.	0
2 HO	ST_S1	R/W	Host Interface test mode. 1'b1 force external I2C.	0
1 HO	ST_S0	R/W	Host Interface parallel type selection. 1'b0 8051 parallel type.	0
0 D	UAL	R/W	SPI Interface dual output mode. 1'b1 dual mode.	0

0x9C – MCU External Timer Clock 0 Divider High Register

Bit	Function	R/W	Description	Reset
7-0	T0_DIV_H[7:0]	R/W	T0_DIV_H[7:0]	0

0x9D – MCU External Timer Clock 0 Divider Low Register

Bit	Function	R/W	Description	Reset
7-0	T0_DIV_L[7:0]	R/W	T0_DIV_L[7:0]	90

0x9E – MCU External Timer Clock 1 Divider High Register

Bit	Function	R/W	Description	Reset
7-0	T1_DIV_H[7:0]	R/W	T1_DIV_H[7:0]	0

0x9F – MCU External Timer Clock 1 Divider Low Register

Bit	Function	R/W	Description	Reset
7-0	T1_DIV_L[7:0]	R/W	T1_DIV_L[7:0]	90

0x93 – MCU External Timer Clock 2 Divider High Register

Bit	Function	R/W	Description	Reset
7-0	T2_DIV_H[7:0]	R/W	T2_DIV_H[7:0]	0

0x94 – MCU External Timer Clock 2 Divider Low Register

Bit	Function	R/W	Description	Reset
7-0	T2_DIV_L[7:0]	R/W	T2_DIV_L[7:0]	90

Datasheet revision history

Date Revision	Note
12/07/2007	Add power consumption information.
01/15/2008	Add RoHS Label. Change MCU pin name and description.
02/05/2008	Update video decoder and analog power information. Update OSD functional information. Update Register {0x002, 0x1B1}, remove Register {0x1B2, 0x1B3, 0x1B4}.

0x0D – Vertical Scaling Register, Low (VSCALE_LO)

Bit	Function	R/W	Description	Reset
7-0	VSCALE_LO	R/W	These bits are bit 7 to 0 of the 12-bit vertical scaling ratio register	00h

0x0E – Scaling Register, High (SCALE_HI)

Bit	Function	R/W	Description	Reset
7-4	VSCALE_HI	R/W	These bits are bit 11 to 8 of the 12-bit vertical scaling ratio register.	01h
3-0	HSCALE_HI	R/W	These bits are bit 11 to 8 of the 12-bit horizontal scaling ratio register.	01h
